1079. Re: 40 Meters??

Yahoo group: mkars80
Date: 2009-08-15 21:40:03 UTC
From: g3oth
Topic: 1070 Message: 1079

Ok Steve, well since the VFO is qQRP already compared with the final PA output which in turn is QRP compared with most signals on 40 meters and likewise the 2nd Harmonic of VFO is probably 20dB or more further down and even if PA LPF not brilliant @ 6 MHz where QRO 49 meter band BC stations abound, I dont suppose such a version of a MKARS40 would be a threat to anyone. So perhaps you could give it a try and further save yourself the bother of designing and stocking up with 12 MHz Xtals. Although 3 : 2.8 (or worse 3 : 2.7 for whole of American Band) ratio is a tad more than ratio required for the MKARS80 VFO range, I would think by using a bigger L you would get away using the existing Polyvaricon etc.

From: Steve Drury
Topic: 1070 Message: 1080

I will investigate, I'm more worried about being seen as "clean" - if I remember correct the USA requirement is all spurii at least 43dB down on carrier. I could use a simple trap but most constructors wouldn't have the kit to align it.

1081. Re: 40 Meters??

Yahoo group: mkars80
Date: 2009-08-16 09:31:52 UTC
From: Ron
Topic: 1070 Message: 1081

Hello Steve and all,

In March of this year I conducted several experiments to convert one of my MKARS80 into an MKARS40. Some of you, including you Steve, may remember that I finally gave up. The main reason was that I could not get spuriuos radiation within acceptable limits. Another reason was overload by broadcasting stations still present on the 40m band, which was a nuisance at night time. In addition the MKARS40 was plagued by mirror frequencies. First I decided to make it easy on myself and tried 10 MHz (as in the MKARS80) as IF and the VFO running at 2,9 MHz. The second VFO-harmonic was way too strong in the output, a fact for which Steve had warned me. Tightening the LP-filter and the bandpass filter did not help much. I then tried 12 MHz as IF. This was slightly better but I could not get the displayed frequency right since the PIC assumes 10 MHz to be the IF.
I was about to try and use a 5 MHz IF when I decided to convert the MKARS40 back to an MKARS80 before I would definitivelye destroy the PCB.
I did make some QSO's with each version of my MKARS40 and I have put a short video clip in the files section to illustrate that. I still find it a pity that I did not find the time and courage to pursue the MKARS40 as the 40m band has recently become more interesting after it has been widened up. It also lends itself somewhat better to QRP-operation than 80. For instance I listen sometimes on Sunday mornings at 8.30 UTC on 3.690 to hear some sign of life from UK MKARS80 owners, but without result so far. I believe on 40 this would be better.
Anyway, perhaps some day someone will take up the glove and develop an MKARS40. If there is anything I can do to help I will be glad to.

Topic: 1070 Message: 1082

How about a Chebyshev with Added Zero filter ?
http://www.arrl.org/tis/info/pdf/9902044.pdf

Also maybe an 11 Mhz IF ? Similiar to what is used on the BitX20A and BitX17A at http://www.qrpkits.com/bitx20a.html

The 10 MHz Time signal can be fairly strong at times here in the USA

Ron,
I haven't forgotten you, I'm still working on the 12MHz IF version. Filter is being a bit tricky but not given up yet!

I will update the group when I have something to report.

Steve G6ALU

1084. Re: [mkars80] Re: 40 Meters??

Yahoo group: mkars80
Date: 2009-08-18 21:22:26 UTC
From: Steve Drury
Topic: 1070 Message: 1084

David,

With a 10MHz IF the problem would appear to be the second harmonic of the
VFO around 6MHz so unfortunately an improved LPF won't help.

Using a 11MHz IF doesn't really help either as the second harmonic of the
VFO will be about 8MHz, still too near the wanted output of 7-7.3MHz.

Steve G6ALU

1086. Re: [mkars80] Re: 40 Meters??

Yahoo group: mkars80
Date: 2009-08-19 20:56:47 UTC
From: Steve Drury
Topic: 1070 Message: 1086

Thanks Ron I will let you know - I'm busy at the moment bagging kits up for
3 mobile rallies we have coming up; Rugby, Milton Keynes and Loughborough.

Steve

1087. A new mkars80 builder / user

Yahoo group: mkars80
Date: 2009-08-21 05:28:57 UTC
From: Nick Brok
Topic: 1087 Message: 1087

Hello,

Let me introduce: I'm PE1GOO and have just received my mkars80 kit.
Opening the package was a real surprise!
The delivery-time was fast (ordered last weekend and received yesterday).
I'm going to start building the radio and hope it will do as well as my bitx20 and bitx17.

Greetings,

Nick Brok, de Pe1GOO

1088. Problems with winding T2

Yahoo group: mkars80
Date: 2009-08-23 04:47:41 UTC
From: Nick Brok
Topic: 1088 Message: 1088

Hello everyone,

I've build my kit and all went oke, except transformer T2.
I had many problems winding the thick (22 SWG) wire into the pig-nose without damaging its insulation.
Two questions:

1. Why is the wire so thick? (On BITX it is 27 SWG)
2. Is there a trick to wind it without damaging the insulation?

I spoiled all of the 22 SWG wire.... badly.....

With other kits I had no problems, because the wire wasn't that thick.

Is it possible to use the thinner 27 SWG wire for this transformer?

Greetings,

Nick Brok, de Pe1GOO

Nick,

It is possible to use the 27 SWG wire, I've seen it used in error without any problem - I used thick wire to keep resistive loses low although 27 SWG should handle a couple of amps (peak) OK.

1090. This morning's sked

Yahoo group: mkars80
Date: 2009-08-23 09:09:41 UTC
From: Steve Drury
Topic: 1090 Message: 1090

Six of us on the sked this morning:

Myself, Steve G6ALU - Milton Keynes

G4OZG - Ted, Kings Lynn - 5/8
G7HSA - Adrian, Ludlow - 5/8
M1EEL - Mick, Erith - 5/7
G4NJJ - Peter, Kings Lynn - 5/8
G3UD - Graham, Stoke on Trent - 4/7

Band conditions were reasonable apart from some co-channel interference from QRO stations!

Sked details:
Sunday @ 8:30 UTC, frequency 3.690MHz ± QRM.

Steve G6ALU

Nick,
Yes it is hard to wind this one without scraping the enamel off the wire.
One tip passed on to my by a veteran constructor, Mike G7ING, is to carefully chamfer the edges of the holes with a larger sized drill. This stops the wire dragging as much. It seemed to work, and I think has minimal effect on the completed coil parameters.
A further tip is to use a child's crayon to wax the chamfering, which lets the initial windings slide better.

A few more tips, worth repeating as they might save the midnight oil for any new constructors....

Another tip is to debur and inspect under magnification the holes paying particular attention to the output transistor, as a small sharp fragment, not visible to my diminishing close up vision can pierce the insulating pad, creating a short circuit.

Finally,
Heat strippable enamel in my experience isn't!
Now I prior to mounting and soldering on the board I heat strip the enamel, tin with solder and continuity check the tinned ends.

Hello Steve,
Many thanks for your reply. I've used the smaller wire and fixed in this way the problem to my Mkars80

An update on MKARS40 progress

I modified my development MKARS80 to 40 metres operation by changing the VFO frequency, low-pass filter, band-pass filter and the xtal filter from 10 to 12MHz, the radio worked as I mentioned before but had several problems:
1.. Crystal filter was much too wide - this has been cured by altering termination impedance and load capacitance, now works nicely and sounds good.
2.. Dynamic range insufficient - broadcast stations above 7.200MHz have extraordinarily signal strength! The way I've got round this is as follows; fitted a volume control in the fine tune control position and increased the gain of audio amplifier stage Q6 (R18 now 100K), this enables the RF gain to be reduced significantly with the additional benefit that background "hiss" from the front end is reduced. A multi-turn adapter will be used on the VFO. These modifications might be usefull on an MKARS80.
3.. Modulation indicator no longer works correctly - viewing the output waveform on the scope shows the transistor no longer "bottoms" at 0V - possible solution is to change the 2V7 zener for 3V3, to be proven.
4.. Transmit spectrum has 5th order products (from the mixer) only 40dB down on the carrier - not yet solved, investigation continues.
Without modification number 2. the radio really sounded a "dog"! Now it sound quite delightful wandering around 40M, you have to be able to use an RF gain control properly though.... you soon learn! I've spent most of the weekend working on it and I guess there will be many more hours needed before (and if) I have a saleable product.

From: pa0rcl
Topic: 1070 Message: 1095

Fine business Steve, you seem to have made more progress in just one weekend than I did in a month!
The problems you encounter coincide largely with the ones I had. In addition, I had a problem with the frequency display, i.e. with the PIC firmware. I just could not get the PIC to subtract the VFO frequency from 12 MHz instead of 10 MHz. Also, the huff&puff range was insufficient.
I reduced the spurious output by incorporating a 5th order Butterworth filter after the VFO and. Also, I put some trap filters in the receiver's front end an added an AGC circuit.
With all these mods I felt the MKARS40 drifted away too much from the original MKARS80 design, which is brilliant. With the MKARS40 there were just too may things added outside of the original PCB, which made me think that the MKARS40 requires its own approach.
Personally, I hope you will pursue the good work. Perhaps an email-poll (not a post) amongst the members of our community will help to decide whether an MKARS40 is worth the trouble?

1096. MKARS 80 kit completed

Yahoo group: mkars80
Date: 2009-08-24 02:03:38 UTC
From: jarnold144
Topic: 1096 Message: 1096

Hi gang,

Just finished building and testing the receiver part of the MKARS 80 transceiver. Works like a charm...if I didn't have so darn much QRN here...mostly our own Plasma TV I'm afraid.

Kit went together in two days with no problems except some confusion when it came to adding the display, but all good now.

Don't have a mic on the rig yet, so must wait a while to talk. Happened on to the Washington state USA traffic net just as testing began which made alignment easy.

Thanks to Steve for a very nice PCB layout and very good instructions!!

Hello all -

Looking over my copy of the schematic I don't seem to be able to find Swd12v out. Only five Swd12 ins. Could someone give me a general location on the schematic were it is.

Thank You

David Goodrow

Just checked the diagram... you are correct! Switched 12V out (with the arrow going out) should be indicated at the cathode of D6.

No one has mentioned that before, I will fix it at next up-issue of the diagram.

Hi David
There doesn't appear to be a connection shown between the !2 volt plus DC Power Connector on Steve's schematic and SW 12 volt (in).
However if you assume that thereon SW 12v always refers to the 12 volt rail irrespective of being in RX or TX mode you wont go far wrong.
RX 12v is only present when in RX mode and TX 12v is only present when in TX mode, both being dependent on the state of the Relay RLY 1-b, which in turn is switched by the ring of the Mike Jack connection being returned to ground when the latter is activated.
I can assure you that there is no problem with the PCB layout etc. if you insert the components correctly, and you do not need to worry unduly about the relevance of these various 12 volt suffixes when wiring up the kit.
Best of luck with your construction and I am sure you will be delighted with the results.

1101. Differences between versions?

Yahoo group: mkars80
Date: 2009-08-30 04:08:43 UTC
From: ae5xae5x
Topic: 1101 Message: 1101

Good evening all,

I'm finally getting around to building my MKARS80 and see that they are now up to V1.3. Mine is V1.1 and I'm curious about the specific differences between versions. Any changes or substitutions in parts values I should make?

Thanks and 73,

John AE5X

John,
Make sure you use the V1.1 manual as some of the component values differ - these were only due to availability (they went obsolete) not performance.

C59 and C60 changed to 1nF NP0 type capacitors or polystyrene types for a significant improvement in frequency stability. I can send these out to you if you send me a personal mail with your address.

Software has changed to V2.4 which is a little easier to use (in the files section).

Regards,
Steve G6ALU

From: JEREMY CARVILL
Topic: 1101 Message: 1104

Hi John,

I've just started to build mine also, after receiving it about six months ago! Like you, I was curios as to the differences in the versions. I downloaded and printed the 26 pages of what I thought was the latest version from the site, V1.2 only to discover that the kit referred to version 1.3! I contacted Steve and he let me know the subtle changes so that I wouldn't have to cut down another rain forest somewhere.

Now that I have set about building the kit, I noticed that the final page of the manual clearly shows the changes that have taken place since the first version was released.

I've read every post that has been sent to the forum before I set out to start my kit. Steve, and others have been absolute stars in the advice that they give. The kit is so easy to assemble in a step-by-step logical fashion that even I can be brave enough to have a go. I don't have some of the expensive professional test equipment that some of the builders refer to and so I hope that this won't prevent me in completing a successful transceiver.

So far, I've completed two of the six bags over two evenings. I take my hat off to those whom have reported that they had completed their kit the day after they received it!

Anyway, good luck with your project and hopefully will make contact with you on 80metres sometime in the future. I'm off to start bag number 3!

1105. Problem with the display, or pic

Yahoo group: mkars80
Date: 2009-08-30 21:23:00 UTC
From: marcovdbos
Topic: 1105 Message: 1105

Hello group,

This evening I've finished my Mkars80, per the directions of the manual.
Everything goes well, the RX works, also the display.
But then the display makes contact with the board, and the display only shows strange signs, and direct after that only blocks.
Now the display only shows these blocks, when put on.
I've measure the pic-processor;
pin1=0V
pin2=1,55V
pin3=0,2V
pin4=0,09V
pin5=0V
pin6=4,94V
pin7=0,2V
pin8=4,87V
pin9=2,46V
pin10=1,56V
pin11=1,63V
pin12=2,03V
pin13=0V
pin14=4,94V
pin15=-0,29V
pin16=1,9V
pin17=3,28V
pin18=0V
Powersuply gives 12,4V
I think the display, or the pic is defect, maybe both?
What does you think?
And how I can best solve this?
The rest is working fine.

73,
Marco,
PE3M

1106. Both audio amplifiers

Yahoo group: mkars80
Date: 2009-08-30 22:35:53 UTC
From: Nigel Gunn G8IFF/W8IFF
Topic: 1105 Message: 1106

Just built the CW adaptor.

As everything is going in one box, I obviously don't need both audio amplifiers, we already know that the audio chip is
excessively noisy.

Is there sufficient output from Q3 collector/IC1 pin 3 to drive the CW filter/amplifier and not use MKARS80 IC1?

FB Jem - sounds like we're at the same place. I just finished Bag 3 with the exception of the inductors/transformers - I'm taking a breather before I start with those doodads but the board is starting to resemble a radio at this point, isn't it.

I agree with you about the guys who finish this kit so quickly but that's not in the cards for me!

Jem, I've got some *serious* antenna work to do if you and I have any chance of a QSO on 80m with 5 watts. I guess I'll break the news to my wife tomorrow about the 4-square I'll be putting up in the backyard ;-)

73 for now and I look forward to hearing your results with the build,

From: Steve Drury
Topic: 1105 Message: 1108

Nigel,

I think "excessively noisy" is an exaggeration after all these aren't HI FI amps! Mine produces a barely discernible audio hiss in to a loudspeaker.

There won't be enough drive at Q3 collector to drive the CW adapter as standard, the CW adapter has an attenuate at its input. Looking at the CW adapter; try removing R38 and connecting otherwise as designed - that might work.

Hi Steve,

No need to, I've fixed the problem.
The wires of the display makes no good contact.
I'm on my work now, and get some thicker wires, that fits beter, and that will do the trick!
Also put some tape on the back of the LCD.
Thanks for your quick response.

73,
Marco,
PE3M

Keep the plastic tray thing you get when you by something blister packaged.
Its ideal for backing circuit boards like the MKARS 80 display.
The boxy type ones that you buy things in are also great for mixing two-part adhesives in.

From: rameses32
Topic: 1115 Message: 1115

And if so how do I order one with my MKARS80 Kit, I will be ordering it next week and would like to order a cw adapter kit with keyer option and a case too at the same time. Now if you guys had an ATU that fit into the same size case, woohoo:)

Charley, Steve has probably gone off to bed as its late over here now, but he will likely reply to you first thing in the morning. As far as I know the CW kit is available off the shelf now and it incorporates the auto keyer as standard. I built one here about 4 or 5 months ago when he first launched it and it works fine.
A case comes with the transceiver kit but you will have to ask Steve to quote you separately for a case for the adapter.
As far as the ATU is concerned most guys seem to be using there own favourite configuration, but I agree, there could be some mileage in doing a kit that incorporates an AMU, Dummy Load and Power / SWR Meter to complement the MKARS80 if the take up and price was right and Steve was prepared to give it a go.

Latest update on the MKARS40

From last time...

" 4.. Transmit spectrum has 5th order products (from the mixer) only 40dB down on the carrier - not yet solved, investigation continues."

Investigation showed they weren't 5th order but 3rd order products, by tuning across the band some were only 15dB down!

I substituted an SBL1 mixer for the homebrew one and the problem disappeared so then decided to try some very expensive Schottky diodes in place of the 1N4148s. Whilst fitting the diodes I noticed a broken wire on one of the ballun cores - repairing it fixed the spurii problem, whoops!

Any unwanted spurii are now between 55 and 60dB down on the PEP signal, is this sufficient? As I stated before the controls would change and are now (from left to right) AF gain, tune and RF gain; having the AF gain on the left and RF gain on the right is unorthodox but is it acceptable - comments are invited.

Hello Steve,

Well done on the experiments and OK on the "whoops" we all have those :-).

I can't see a problem with the AF & RF controls being unorthodox. And as the tuning is in reverse we can think of it as a mirror image, OK enough of this flippancy. Seriously though its acceptable in my books and I will look forward to one if they go into production.

Cheers and 73 Tony ZL3HAM

Well Steve that's no worse than concentric AF/RF gain pots on Kenwood equipment and where the RF gain pot, when turned down drives the S meter hard over to the right!

1122. Function of the LED

Yahoo group: mkars80
Date: 2009-09-04 05:35:24 UTC
From: Nick Brok
Topic: 1122 Message: 1122

Hello,

Perhaps a stupid question, but how does the LED works. When I push the PTT it lights up and when I modulate the light is dimming in the same rhythm as my modulation.
I thought it works in the opposite way.
I'm a little bit confused.... What kind of information does this LED give me?

Greetings,

Nick Brok, de Pe1GOO

Hi Nick

Page 16 of the instructions (Modulation indicator)V1.3 should explain it. Your soon get to know best distance for good tx audio,over 120 contacts so far here in jo01 with my version.
Good luck
Allen

Hi Ron,

The only mod on the PCB (apart from MANY value changes) was to remove R28 and in its place fit 2 wires to the AF gain control.

When I have time I will publish the AF gain control modification as I feel some will benefit from it on 80M - you need a slow motion drive first of course! I'm just about to check availability.....

Thanks for answering Allen,

The LED is powered from the TX supply so will light when the PTT is pressed; the LED driver circuit also monitors the voltage on the PA transistor Drain, when the transistor "bottoms", that is when it is turned on and becomes non linear the LED will turn off.

By monitoring the LED during TX it is possible to ensure you don't over drive the PA stage, the drive required (how loud and close you speak in to the microphone) depends on supply voltage and antenna impedance. Remember the simple transmitter doesn't have ALC, you have to perform that function!

From: pa0rcl
Topic: 1070 Message: 1127

Hi Steve,

I do appreciate the fact that many component values had to be changed and I am very interested to know which ones, and their new values. You will remember that I sent you such a list when I modified one of my MKARS80's into an MKARS 40 last March. Also, I am interested in the modified PIC code as the IF is now 12 MHz instead of 10.

For me personally the placement of the various pots on the PCB is not an issue as I use detached ones and instead of a slow motion drive I use a 10-turn pot for the varactor tuning. I also split up the band the band in three switchable 100 KHz segments, so each turn of the pot is 10kHz on the average. Thus, no further fine control is needed for the tuning. After a year or so of use, I am still quite happy with this.

I do hope you can find the time to post the list of changes and the modified code for those interested. At least I will be more than happy to act as a beta-tester. I will buy another MKARS80 to convert it into a 40 right away rather than having to desolder many components from an exsting MKARS80 and maybe damage the PCB.

Thanks and 73,

Ron de pa0rcl

From: Nick Brok
Topic: 1122 Message: 1130

Hi Steve,

Thanks for explanation... page 16 didn't explain much to me, perhaps my English is to bad. So if the LED isn't lighting up then my modulation is to high.

Thanks.

Greetings,

Nick Brok, de Pe1GOO

Thanks for answering Allen,

The LED is powered from the TX supply so will light when the PTT is pressed;

the LED driver circuit also monitors the voltage on the PA transistor Drain,

when the transistor "bottoms", that is when it is turned on and becomes non

linear the LED will turn off.

By monitoring the LED during TX it is possible to ensure you don't over

drive the PA stage, the drive required (how loud and close you speak in to

the microphone) depends on supply voltage and antenna impedance. Remember

the simple transmitter doesn't have ALC, you have to perform that function!

If the led goes out excessively whilst speaking, your modulation is too high.

Completed construction today of the components (still have the metal work to go) and the receiver gets a clean bill of health. A typical summer-in-Houston thunderstorm cut the fun short but I had enough time with the rig on the antenna to know all is well so far.

Hi all, poor conditions today (S9 noise level) could hear one stn. but could'nt read.
Just finished my CW Adapter and seems to work OK. Maybe if anyone else
has one up and running we could QSY to 3.560 if 3.690 is poor? (QRS PSE !)

Sorry I haven't been on the sked for a couple of weeks - MK Rally last week and a trip to the out of hours doctor today.

I wont be on again next week as Radio-Kits will be at the Loughborough rally.

Not yet Steve - we are having a holiday weekend here with no mail service till Tuesday. I tuned around last night and there were wall-to-wall signals up and down the phone portion of the band from several call areas. Antenna is an 80m dipole up 65 feet. What amazed me was how quiet the receiver is between signals. I'm primarily a CW operator and among all the CW QRP kits out there, the OHR-100 series is well-known (and loved) for this trait...makes extended listening so much more comfortable.

Several stateside hams have emailed me to tell me that they have the kit but have not yet started construction. One of them is literally down the street from me. I wish they'd fire up the soldering iron so we could enjoy an MKARS80-type net like you G-guys are doing...

1143. Help wanted, no output from VFO

Yahoo group: mkars80
Date: 2009-09-18 23:57:19 UTC
From: rameses32
Topic: 1143 Message: 1143

I'm going over everything right now, but I finished the radio last night, checked the regulator voltages and attached the LCD. The Freq is @.000.000 and all I get is white noise through the speaker, no difference when connected to an antenna. This tell me that the VFO isn't running. I don't have a scope only a volt meter to diagnose with. Right now I am going through all of the solder joints and checking polarities etc, but any hints at this point is greately appreciated.

Grrrr, I checked everything turned it back on and it was working, great, I put it in the case and turned it back on and now it's not working again. pulled it out of the case and it's still not working , checked the 10Mhz test point and got 9.8MHZ checked the vfo test point
and got nothing. Ok, so atleast I now all the bits are working, sounds like I am tracing a bad solder connection or some solder swarf.

No problems at all mate, all I can say is what a Kit! Took me 1 hour to drill and cut the case, 12 hours to solder everything together and fit it to the case and 1 hour trouble shooting and 30 minutes to adjust it. The reciever works great with good selectivity. The audio is very loud and clear, I am quite suprised, it has the best sound I have ever gotten out of a 386. Very stable, minimal drift, comparable to my Kenwood 120S. The whole rig is alot smaller than I was expecting, I didn't relise in the pictures that it uses 1/8 watt resistors, thinking it was 1/4 resistors I thought it would be a bit bigger. All in all, I am blown away by this radio. I'm still trying to make a contact with it. I'm not sure of my output power, it sounds great through my Kenwood sitting next to it but I don't have a power meter to measure output.

I Adjusted R2 from 230mA to 280mA as the manual said but nobody on air has been able to hear me, but everyone I am listening to is more than 500klms away tonight, but I'll keep trying. I'll let ya know when I make my first on air contact.

Charley,

Glad you like it - when you talk does the red LED flicker off? It should do, if not you may not be transmitting, also when you talk does the current go up?

Make sure you have adjusted the BFO to 10MHz as this will make a big difference to TX quality.

Regards,
Steve G6ALU

From: rameses32
Topic: 1143 Message: 1149

Just made a couple QSO's about 300klms away, I was current starving the radio by trying to use too small of a battery pack. But the LED still never flickered.
As for current, it only climbs to 330mA when I speak loudly or whistle into the mic.

As for the BFO, there was a net on a specific frequency and I set the radio to that frequency and adjusted the BFO until everyone sounded correct.

From: Steve Drury
Topic: 1143 Message: 1150

OK, 330mA is low, with a 13V power source I would expect to see an amp or more so I'm afraid there is some more checking to do!

If all the transistor voltages are OK I would check the mixer transformer connections first and then the transformers in the TX section for correct number of turns.

Thanks for that, it's 1:30 AM here so I'm calling it a night, I'll do that tomorrow and let you know how I go, thank you for all the help.

1152. Re: Help wanted, no output from VFO

Yahoo group: mkars80
Date: 2009-09-20 13:47:07 UTC
From: rameses32
Topic: 1143 Message: 1152

The radio is fixed and working awsome. Problem was the diode on Q20 was backwards, found it by checking transistor voltages. I recieved several signal reports tonight, some as far as 1,000klms away, everyone said my audio was excellent and many were suprised that I was only putting out 5 watts. Actually it punches out 8 watts on a whistle, but I don't recommend that. The final never even got warm on a bit of a rag chew.

Anyway, great kit, and even better radio, I think the Kenwood is going to get pretty dusty for a while because the MKARS 80 will be my main rig for quite some time.

Thanks Guys
Charley Loomis

Charley, glad to hear that you have got everything fixed and that you are enjoying your new radio. It is a great little rig and a real credit to Steve and his XYL and MKARS members endeavours.

1155. Modulation to high in mkars80

Yahoo group: mkars80
Date: 2009-09-23 13:32:28 UTC
From: Nick Brok
Topic: 1155 Message: 1155

Hello Steve and others,

My mkars80 had its first try on 80 meters today and the modulation is a (very) lot to high. The led is already off when I speak with a low voice into the microphone. On the other site they told me the modulation was a lot to loud.
I use a normal electret mike (The ones with the FET pre-amplifier build in.)
Can you suggest me a modification for this?
It picks any sound in the room and it's producing enough modulation for 5 watts output without saying anything!
The room is not that noisy, normal background noise as in any normal room.

Greetings,

Nick Brok, de Pe1GOO

Nick,

My first suggestion is to try a different microphone just to make sure this isn't the problem - next check for wrong component values, the problem is most likely in the microphone amplifier circuit.

In normal use I speak about 20cm from the microphone.

Do you have an oscilloscope? If so I can give you some levels to measure.

Regards,
Steve G6ALU

I' ve an Oscilloscope so some values will be helpful.
Wrong components used in circuit? I think not, because everything I checked twice.
I think my electret microphones have a to high gain pre-amp.
I don't know the type, because it are condensator FET-pre-amp mikecapsels.

Greetings,

Nick Brok, de Pe1GOO

Nick,
When speaking normally into the microphone the waveform at Q4 emitter is 1 - 2V P-P.

To produce an output of 5W from a steady "whistle" requires 700mV at the base of Q21.

I hope this helps?

Regards,
Steve G6ALU

1159. Hello all High in Freq

Yahoo group: mkars80
Date: 2009-09-23 17:01:04 UTC
From: Adrian Rees (MW1LCR)
Topic: 1155 Message: 1159

Hi all

I have just finished assembling my MKARS80.

I have lost a 1K resistor during the build and R95 is missing. (I'll replace it tomorrow when I go to Maplin's). Co-incidentially I had a spare capacitor, one of the 100nF ones.

I have checked the board twice over, thinking I've put a resistor where a capacitor should be, but can't spot it. Anyway, powered it up and all OK, to the point I set the band up. The display is reading 4.018MHz to 4.411MHz. My guess is that L5 has been wound incorrectly.

I'll replace r95 tomorrow, but is the opinion that L5 is in correctly wound the right way to go ?

Certainly receiving stuff on the receiver. Brilliant kit, and I've really enjoyed building it last night and this afternoon.

HI Adrian,
I can pop a resistor in the post if you like... let me know.

You need 51 x 100nF capacitors but Val puts 52 in the bag just in case one of us loses one, sorry if its confusing but at least you checked your board!

Showing around 4MHz doesn't sound unreasonable if you haven't set it up yet - adjust the orange trimmer capacitor for a coverage of 3.5 to 3.8MHz - if you have tried to adjust it then the VFO is running high in frequency so check to make sure there are enough turns on L5.

Hi Steve

No worries on the resistor, as I am off to town tomorrow anyway.

I have re-wound L5, as I used the wrong wire.....D'Uh!

Its now in band 3.4MHz - to about 4MHz.

I'll wait until I have the resistor to finish off the alignment etc.

Thanks

Adrian MW1LCR

1163. RE: [mkars80] Hello all High in Freq

Yahoo group: mkars80
Date: 2009-09-24 16:17:31 UTC
From: Adrian Rees (MW1LCR)
Topic: 1155 Message: 1163

Hello

I managed to get a 1K Resistor so no worries.

Well my MKARS is on Freq and working well on RX.

On TX, I have a standing current of 110mA and that goes to 170mA on TX.

However no TX'd Freq, and the Red LED doesn't extinguish (or dim) on voice peaks.

Using my 756ProII I can't hear any crackles or pops when I TX, even on the same Freq as the MKARS.

I'll check the PC Board later tonight for dry joints etc, as I found one testing the RX.

Any hints & tips ?

Thanks

Adrian MW1LCR

From: Steve Drury
Topic: 1155 Message: 1164

Adrian,

On TX the quiescent current is normally about 270mA before the output transistor bias is set so you have a problem. Check to see if Q5 is geting very warm / hot, it should do!

Even so you should be able to hear yourself on another receiver.

1165. RE: [mkars80] Hello all High in Freq

Yahoo group: mkars80
Date: 2009-09-24 17:18:41 UTC
From: Adrian Rees (MW1LCR)
Topic: 1155 Message: 1165

Hi Steve

Q5 is stone cold. Even switching to TX (the relay changes over and the current consumption increases) but nothing else.

I'll check for dry joints etc later.

Adrian

1167. NO SMOKE !

Yahoo group: mkars80
Date: 2009-09-24 18:12:51 UTC
From: Hasse
Topic: 1167 Message: 1167

Good evening !
Finished my MKARS80 last night (very late)and did the final meserment and the result was good i thougt.Put the 13.8 V-DC to the PCB and there was no smoke or flames.Even better i thougt.The RX came very nicely and
so did the TX too.I an half on hour i worked DL - ON - G -Ha and
a DL-OZ.The output is just ab. 6W and i think the RX is absolutly OK
for this wonderful little QRP-station.Now it`s time to put it in to the
cabinet.Thanks for a fantastic 80m QRP-kit.

Topic: 1168 Message: 1168

Hi Steve

I have been building my MKARS 80 very slowly, concentration problems after a stroke, and have come a cropper with the 10 way sil

I lost concentration and broke it 7 - 3 when I tried to cut of the 1 it flirted off and landed I know not where. As if that wasn't bad enough I fitted the six way on the component side!! I had to cut it to pieces and unsolder it pin by pin then cleaned the holes with a solder sucker.

Where can I get a replacement 10 way SIL

thanks

Phil G6AKK

No problem Phil I will get a replacement in the post to you - you did the right thing by removing each pin separately as it saves damage to the board.

Please send me your postal address to g6alu@... and I will get a strip in the post to you straight away.

Steve G6ALU

1170. My little MKARS-80 is generating a bit of interest on air

Yahoo group: mkars80
Date: 2009-09-24 21:57:12 UTC
From: rameses32
Topic: 1170 Message: 1170

I have been asked many times about information concerning the kit for this little rig. They hear me on air talking about it and end up wanting one themselves. The whole reason I got into Amateure radio was to use equipment I built myself and the MKARS-80 fits my idea of Amateur radio perfectly.

The other night I was having a rag chew with someone using a K2 and I heard a station on a nearby frequency, and it was getting difficult to hear the station I was talking to, just when I had chalked it up to the MKARS-80 not having a very selective front end, the station I was talking to ask me to wait a second while he switched in a filter because he was getting blasted by someone on a close frequency. Well that made me feel good because someone with a $1900 radio was having the same problem I was having on my $120 radio, ok sure he just switched in a filter and eliminated the problem, but he paid more than $120 for that ability.

As far as transmit goes, most contacts can't believe I am only using 5 watts, it reminds people that you don't need 100 watts or more all the time. Or an expencive antenna and tuner. My antenna consists of a 6 metre pole up the side of my house with a full length 1/4 wave 80m dipole made of scrap wire and a piece of PVC pipe for an insulator. It's fed with coax. My tuner is a couple of Air Gap Caps and two large coils wound on some perspex stuffed into an old computer case and an SWR pulled out of the rubbish and repaired.

Charley

Hi all

I found a dry joint that seems to have cured some of the problems. The current consumption on RX is 120mA and on TX 290mA (it was about 235mA before I adjusted R2).

The output transistor (Q1) is now getting warm on TX. However, still no sign of RF coming out of it. I'll re-check the joints again I can confirm Q5 is he right way around !

Adrian

Check voltages on it and also make sure its the right way round!

Topic: 1155 Message: 1172

Does the current go up when you whistle into the microphone?

Best first step is to check the voltage on all transistors before going
further.

1173. RE: [mkars80] Hello all High in Freq

Yahoo group: mkars80
Date: 2009-09-25 15:27:37 UTC
From: Adrian Rees (MW1LCR)
Topic: 1155 Message: 1173

Hi all

Traced the fault to the junction of R32 and T3. The insulation on the wire hadn't come off properly...now to finish the set and air test it.

I'll let you know how I get on.

1175. Excellent

Yahoo group: mkars80
Date: 2009-09-25 19:07:41 UTC
From: Adrian Rees (MW1LCR)
Topic: 1155 Message: 1175

Hello everyone

I have my MKARS80 now working OK. I am impressed with this little kit and I have had a few QSO's with it.
It was just on the limit of "smallness" for me, anything smaller in component size would have been very difficult. I did find winding the transformers a challenge, mainly as I hadn't done that before.

I did have 2 dry joints in the end.

Any chance of another kit, for say 160m or 40m ?

Very pleased with this and it was just right for me.

I think I have the home brew bug now, but only kits...

73 and thank you for the assistance in getting it going !

Adrian MW1LCR

Hello Steve and others,

Today I succeeded in having a QSO in the Dutch Amateur Net with the MKARS80 with only 5 Watt power!
The other guys where using 100 Watt of power and there was a lot of QRM.
It's giving you a kick that you can have such a success with your home-build transceiver!
It's a nice little 80M transceiver and I hope to make a lot off QSO's with it.
I was transmitting from Eindhoven (brabant) and heart in Friesland (It was not load)

Greetings,

Nick Brok, de Pe1GOO

1177. Display mounting?

Yahoo group: mkars80
Date: 2009-09-26 18:27:17 UTC
From: Randy Moore
Topic: 1177 Message: 1177

I'm to the point of mounting the display and it looks like the display is only mounted to the PCB with a single screw in its upper left, plus the wires down into the socket strip. Is that right? That doesn't seem sturdy enough.

73,
Randy, KS4L

1178. Re: [mkars80] Display mounting?

Hi Randy,

Yes that's correct - you will be surprised how sturdy it is and it doesn't stress the PCB which can cause lost segments.

1180. Mixer balance adjustment?

Yahoo group: mkars80
Date: 2009-09-27 14:59:18 UTC
From: wrmoore47
Topic: 1180 Message: 1180

I am trying to do the mixer balance adjustment with R59 and C103. I have the RF output (antenna) going to a WM-1 wattmeter and from there to a good 50 ohm dummy load. The WM-1 is set to the 100mW range. I barely get any indication on the WM-1 for any setting of R59 and C103. I can zero the output with R59, but there's no change when adjusting C103. I can hear the carrier in my K2's receiver, but it is very weak (I have an 80m dipole connected and the K2 is about 1 foot from the MKARS80). Is this normal, or should I see more response from the mixer balance adjustments?

Everything up to here has gone without problem. My bias adjustment increased the power supply current from 245ma to 295ma (though I found the adjustment of R2 extremely sensitive).

Tnx es 73,
Randy, KS4L

1181. Mixer balance adjustment?

Hi Randy,

This sounds normal, confirm it generates about 5W of RF when modulated and
you should be OK. If you can borrow an oscilloscope some time the balance
can be more accurately set but it shouldn't give a problem as it is.

From: g4pqp
Topic: 1183 Message: 1183

My kit was ordered by post on a Thursday , I received it on Saturday . You cant do better than that . It was well packaged . The P.C.B. is very good quality and all component placings are clearly marked . The building instructions which are available to download on the internet are very detailed and straightforward . Steve has packaged the components in 6 separate bags with a components list in each bag so components that are difficult to identify are kept separate and can easily be recognised . The components from bag 1 are soldered onto the board first followed by bag 2 and so on . Components are fitted in batches of a particular value . Each batch, or single component if there is only 1 has a clear explanation of how the component is identified, eg resistor 22R red red black , capacitor 100pf marked 101 . Component numbers are all listed with a check box next to them so that they can be crossed of the list as they are fitted one by one . My close up eyesight is not very good but with the aid of a pair of 3.5 magnification reading glasses ,reading the pcb legend and soldering the component to the board has not been a problem . I have found that I needed to use a magnifying glass to identify some of the components but again not a problem . I have found that a hands free headlamp (fits on a strap around your head) has been invaluable . The particular one that I use has 7 led,s with 3 intensity settings . I find that the blue / white light is very good for identifying the colour coding of various components . It is currently on offer at Total filling stations for £3. 99 . Construction of my kit is in the early stages . All components from bag one have been fitted and a few from bag 2 . I look forward to its completion and I feel sure that when completed it will give me much satisfaction . Last but not least , many thanks to Steve G6ALU for all of his hard work with the design and development of this kit . You only need to look at this forum to see how successful the kit is and how it has helped to promote the true amateur spirit not only in this country but around the world .

Hey Steve

Your wife's call should be M6VAL. But in any event I like FLO as it
is an abbreviation of my mothers name hi.

Phil's comments came as no surprise to me or anyone else in the group
I wouldn't have thought, and I am only waiting for the MKARS40 hi.

Cheers

Dave

Hello all,

I am Duncan G4DFV, a new member of this group.

Recently I obtained a complete but unbuilt MKARS80 kit (307) in which all the component bags refer to instructions version 1.1.

I have downloaded and printed out the instruction manual version 1.2 which I presume is valid to use with my kit?

Looking at the later manual (v1.3), I have noted the modifications, in particular the changes of two capacitors associated with the VFO for better stability.

Before I begin building, I would like to know if there is anything else I should know that I have missed or isn't covered by the instruction manual that would save me any headaches later on?

Any help would be most appreciated.

Duncan G4DFV

1187. MKARS80 mods by G8EEY

Yahoo group: mkars80
Date: 2009-10-03 19:03:09 UTC
From: panzerbeeb
Topic: 1187 Message: 1187

Hi Steve and all,
After a nudge from Bob G8SDU,I have added a folder to the files section called 'MKARS80 mods by G8EEY', which has a cumulative version of schematic parts for various mods that I have incorporated. Not that there is anything wrong with the kit as supplied, honest, just a compulsion to fiddle with things.
73s Mike, G8EEY.

Hello Mike,

I have just gone to accept the files on to the group but Yahoo says they aren't there! I've had this happen before, last time they re-appeared after a few hours. When this happens I will try again!

Hi Steve,

I have just checked and the folder and file are visible to me, and the 3 photos are in the photo section.

Mike G8EEY.

Hi Steve,

Oo-er, I'd better be careful what I do then....
When I uploaded the photos I did get a 'waiting authorisation' message, so I guess you did manage to allow them even if yahoo said they weren't there. The folder and file in the files area went straight in.

Mike G8EEY.

Sorry for the slow response Duncan, I've been busy this weekend!

For you version V1.2 is appropriate, since this kit was sold there have been a couple of improvements; the first is a modification to the VFO - two capacitors have been changed and the second is a revision to the micro firmware.

I would recommend getting the VFO mod so please send me a stamped addressed envelope and I will send the new capacitors free of charge.

Regards,
Steve G6ALU

Hi Duncan,

I'm not sure if you have a programmer for the PIC to install version 2.4 but if not perhaps I can help?

Please contact me off list if I can do anything.

73, John.

From: Nick Brok
Topic: 1195 Message: 1195

Hello,

After a major modification in the balance-modulator I succeeded in having a good quality modulation. I did some experiments with an electret and a dynamic (300 Ohm) microphone. The electret gave the best quality,
In stead of the piggy-nose transformer I used a toroid as used in the bitx20 (8 trifilar windings.)
Now the minimum carrier-output is 400mVtt in stead of 1.5Vtt!
I think that I made some mistakes winding the piggy-nose transformer. The bigger toroid transformer is working fine.

Now everyone can understand me on 80 meters and I make a lot off nice QSO's.

Greetings,

Nick Brok, de Pe1GOO

Internet Security tips and offers from Tiscali - http://www.tiscali. co.uk/security

---------- --------- --------- --------- --------- --------- -

Hello Steve,There is nothing wrong with your piggy-nose transformers. They are only very, very small. Your method of identification of the connections is confusing because you use only one colour of wire. Because this was the first little piggy-nose-transformer I wound, making a mistake is very easy. My English is not that good also, so I misread your advice

how to identify the windings. I did wound a bigger transformer as in the original bitx20 from Doug Hendricks because your replacement piggy-nose wasn't received yet. I have for that bigger transformer three different coloured wires, so they are easy to identify. The other small transformers are OK, so I know that I really made a mistake with the balance transformer now. The mkars is working great and I can always wind a new transformer when the piggy-noses arrived. But it's working now, so I close the enclosure and make a lot of nice QSO's with it.
Greetings,

Nick Brok, de Pe1GOO

1198. Tune-Up Control ?

Yahoo group: mkars80
Date: 2009-10-07 13:55:36 UTC
From: g8xlh
Topic: 1198 Message: 1198

Hi,

Having built the MKARS80 kit (Very pleased) I would find it very useful
if we could have a "Tune" control to generate an RF carrier. This would be quite useful for testing, and also help with a manual ATU. Is there a simple way to perhaps unbalance the carrier suppression to generate some RF Powerr without using the Audio input.

Regards

Alan

Hello Alan,

This was an issue I had before getting the CW adaptor which is available also from Radio Kits. But what I did prior to this was use a small wire ended piezo sounder (such as Maplins FM59P) off a 1.5v battery and held that to the mic. Yes crude but it worked very well especially if you cant whistle for any useful length like me!!

Hi John,

I did something similar when I was building the kit, I used a morse code practice oscillator to generate an audio tone. I have seen the CW Keyer, and I am sure its a very nice product but an overkill for this application. I did think about making a small audio oscillator, and then reduce the audio feed into the Mic circuit.I guess it would be nice if the tone was not to rich in harmonics ? Any ideas for a good circuit to use ?

Regards

Alan

Why not use a transistor to switch a resistor across the balance pot to get some carrier to the PA?

Hello Alan,

This was an issue I had before getting the CW adaptor which is available also from Radio Kits. But what I did prior to this was use a small wire ended piezo sounder (such as Maplins FM59P) off a 1.5v battery and held that to the mic. Yes crude but it worked very well especially if you cant whistle for any useful length like me!!

You may find the carrier is atenuated by the crystal filter but you are
welcome to give it a go.

Steve

From: J FLETCHER
Topic: 1198 Message: 1204

Hi All!

I bought the MKARS80 kit at the National Hamfest and joined this group last weekend. I've almost finished assembling the board. I must congratulate everyone involved in producing this kit. The quality of the PCB and instructions are excellent, but everyone in the group already knows that...

I wish I'd bought the CW adaptor at the same time, so I could choose a box to fit both. I'll probably buy a diecast box to make it extra-rugged. I'm not expecting any problems with making it work, having built the BITX20 from available parts last year.

Hope to join you on the net soon!

73,

John G4EDX

Welcome John,

I too am a new member of the group.
I also obtained a MKARS80 kit from the
Hamfest - there was one for sale on one of the outside stalls - I didn't know they were for sale inside the main hall - I found this out later!
I must echo your comments John, the quality of the kit
is superb, second to none. The instructions are first class.
Mine is now complete and I am busy fitting it into a case which I have fabricated big enough to also include an internal
speaker.
With a 12.5v dryfit battery as power source, on a whistle it delivers 4 Watts into my 50 ohms dummy load/wattmeter.
Is that about right? (Comments please)
I am looking forward to getting on air with it soon!

Hi Duncan,

Sounds about right, I would expect around 5W from 12.5V... does the LED flicker on and off when talking normally about 6" from the microphone?

Hi Steve,

Yes, the LED does flicker at about that distance - I am using the modified Maplin speaker/mike.

An interesting observation - when I run the transceiver off a stabilised mains power supply set to 13.8 v, I notice I get more power (~ 6 Watts) at the 3.500 Mhz end of the band, and lower power (~ 4.5 Watts) at 3.800Mhz.

I listened around 3.690 Mhz this morning, there was an ON contest station quite close to this frequency and the band near to was crowded with other QSO's going on.

Was there any successful MKARS80 net activity today?

I did manage my first QSO with a station in Warrington who gave me 55/56, then I worked one of the ON contest stations further up the band - (59 of course!).

Duncan,
See if you can count the turns on the LPF toroids, its easy to add one by mistake!

You can try adjusting the BPF capacitors C54, C68 and C79 whilst monitoring the output - check though that you don't reduce the output at the bottom end.

All we could hear on 3.690MHz was a very strong ON station, I heard G4MDR calling around 3.6885MHz so had quite a long chat down there. G4PQP joined us some time later (QRO, MKARS80 perhaps next week!), G3UD was heard call but I couldn't establish a 2 way contact.....

Easiest way of finding out is to measure the AC waveform across R1and
calculate it from that.

My notes say about 50mW.

From: G4DFV
Topic: 1222 Message: 1224

Yes, I tuned around 3.690-ish in vain but I heard nothing only loud JOTA stations, in fact one was more or less bang on 3.690.

The Elecraft net were well in the clear.

A suggestion for future Sundays - (if and when a clear frequency is found) for our MKARS80 net, perhaps it would help others to locate it quicker if the frequency was announced on here at the beginning?

Your right Steve,
I was listening on 3.690mhz this morning,
Good luck to them,will listen for the MKARS group next sunday.

cheers

First time I tried the MKARS80 net Steve, like you said there were a lot of special event stations so did not work any MKARS80's but did work a few special events.

Better luck next week.

From: m0tif
Topic: 1227 Message: 1227

Hello All,

At the recent UK Hamfest a number of Hams showed interest in the paddle / straight key combination being used with the MKARS CW adaptor on the Radio Kits stand. A few of you correctly identified it as of Spanish origin but having it so long I could not remember where I got it from but today have noticed W&S are selling it on ebay item number 320435893485.

Hi Steve . Had a listen this morning but nothing heard . Band very busy with JOTA stations and so on .Have finished my mkars80 board (not boxed)and it seems to be performing well . Have worked a few stations with the board on the bench and have had some nice reports . Looking forward to getting it finished .
73`s all de Phil G4pqp nr Cromer Norfolk .

1231. FET Frying

Yahoo group: mkars80
Date: 2009-10-20 10:52:46 UTC
From: g0cvi
Topic: 1231 Message: 1231

Have just built the MKARS80 and CW adaptor, excellent kits. The MKARS80 was only emitting a few tens of milliwats, so I decided to investigate the voltages. When my insulated probe touched the leg of the FET, a fuse blew, and now there is no RF output measurable with my meter. I can still hear the signal on my TenTec Rx, if the MKARS80 module is out of the box (but not if screened off in the box), so it must be something in the final stages. Any ideas?

The voltages on the FET during TX with sidetone modulation are now

Gate: 4V
Drain: 4V
Source: 0V

From: Nick Brok
Topic: 1232 Message: 1232

Hello,

Is it normal that this transistor becomes hot?
I had some problems with the power meter and checked my MKARS80 with a scope. During the measurements I burned my finger on this little chap. It's becoming hot while in transmit mode. I read in the data-sheet that it might have an Ic of 2A max and that for such a little transistor!

Greetings,

Nick Brok, de Pe1GOO

Yes Storm you have blown your output FET, probably by causing the output
to become unstable when you stuck your test lead on the gate. OOPS :-)

Cheers

From: g0cvi
Topic: 1231 Message: 1236

Thanks for that Steve, that will be very helpful.

I have remeasured the voltages:
When I ground the -ve electrode against the chasis, and use the +ve electrode on the transistor leads I get:
G= 1.4V
D= 2V
S= 0V

When I hold the +ve electrode to the +ve supply and use the -ve electrode on the transistor leads I get
G= 14V (which is the voltage of my PSU)
D= 5.5V
S= 14V

The PD from G to D is 1.2 Volts

All values during tx with a sidetone modulation. Not sure if that makes any more sense?

Thanks

Storm

Storm,

Drain should be 12V relative to ground, check your transformer is wound OK.
I suspect your original problem (low output) is most likely due to a poor
connection on one of the mixer transformers, was the receiver deaf as well?

Regards,
Steve G6ALU

Thanks Steve.

Now I know it's normal that it becomes hot. No reason to worry.
So I can warn a friend of mine (PH7W) ;-) He's nearly ready with building the mkars80.
Don't touch that little transistor when operating the transmitter!

Greetings,

Nick Brok, de Pe1GOO

1240. Tune-up Modification

Yahoo group: mkars80
Date: 2009-10-21 20:52:59 UTC
From: g4dfv
Topic: 1240 Message: 1240

I have done a modification to my MKARS80 transceiver to add a tune-up facility.
A photo of the circuit has been uploaded to my G4DFV album.
The modification involves the addition of a simple sine-wave generator based on the Twin-T oscillator circuit, the output of which feeds into the microphone input.
The single-transistor oscillator runs at around 650Hz, actual frequency is dependent on component tolerances, but isn't too crucial.
Output level is controlled by a preset pot.
A 3-pole changeover toggle switch is used to bring the circuit into play and to change from normal operation to tune. A suitable switch is the Maplin FH08J (Actually a 4-pole, but works OK if a 3-pole is not to hand).
The prototype unit was built on a small piece of 0.1 inch grid Veroboard,fastened to the inside of the case using a double sided sticky pad.
Microphone signals are routed using single-core screened cable (RG174 coax is OK).
Setting up is quite straightforward.
Firstly, turn the preset pot on the oscillator fully anti-clockwise.
Put the transceiver on a dummy load/power meter, supply DC power, then switch to "tune".
Adjust the oscillator output level with the preset pot for maximum output, then back it off to about 75%.
Always remember to keep tuning periods limited to a just a few seconds at a time, with pauses in between.

1241. Buggalo - a tiny CW unit

Yahoo group: mkars80
Date: 2009-10-23 14:15:25 UTC
From: sm0kbw
Topic: 1241 Message: 1241

Hello!

I have constructed a CW-unit / Bugg based on the 12F675.

The 12F675 only draws a fraction of a milliampere. So with a little modification to your MKARS80 it can be feed by the microphone bias.

It's tiny, only around 4 x 4 cm PCB. If you want to construct a surface mount PCB it could be even smaller.

It can be used as a audio keyer, just to plug it in to your MKARS80 and begin send CQ ;)

The file Buggalo_03.zip is placed in the folder named Buggalo and containes all info you need to make your own.

The project is released as a GPL project.

1242. Today's sked

Yahoo group: mkars80
Date: 2009-10-25 10:59:29 UTC
From: Steve Drury
Topic: 991 Message: 1242

Good band conditions allowed for a pleasant MKARS80 net this morning, stations fully Q5 with me were:

G8JWT Roger - Stoke Goldington
G0WKN Ken - South Lincolnshire
G4MDR Alan - Newport Pagnel
G4DFV Duncan - Mansfield
G4PQP Phil - Cromer
G1IVC Colin - Market Harborough

There was a station calling in at the end, sorry we were unable to get the call sign - the band was just starting to get noisy. We will try again next week 3.690MHz @ 9:30 UTC

From: G4DFV
Topic: 991 Message: 1243

Thanks for running the net Steve.
I was really struggling to hear most stations through the very high noise level my end.
At times when the slow QSB lifted, the clearest was Phil G4PQP in Cromer.
Eventually the noise floor was so high, it obliterated all stations on the net.
Due to noise I always find 80m a major struggle, particularly during the morning.

From: pa0rcl
Topic: 1198 Message: 1244

Hi all,

I solved the tune up control issue with just one capacitor, a push button switch and two short pieces of wire. Two .pdf files containing the details can be found in the "files" section, under "tune up control".

73 Ron

Hi Ron, without looking I can guess what you've done!

Hi Ron
Thanks for sharing this mod.
You can't do it much simpler than that.
Wonder if Steve's guess was correct, and whether he approves.
I can't see much wrong with your suggestion, if phase and amplitude of feedback is ok, presumably the result is a nice sine wave. The only thing I would like to know is whether or not audio overdrive to TX presents any problem. Otherwise I might give it a go here.

No I guessed wrong!

I thought he was unbalancing the carrier insertion mixer.... looks OK as long as the TX isn't too far overdriven and causes splatter - I guess it doesn't matter for a few seconds though.

Hi Steve,

In your opinion, is there anything wrong with unbalancing the carrier insertion mixer?

I'm not sure it would work as the crystal filter is likely to filter most of the carrier out. Give it a try and let us know!

From: g6ivp
Topic: 1198 Message: 1250

Hi again Steve

Oops! I should have known better. I see now that there is likely to be enough attenuation that it might not be any good for tune up. Too little power. Best to keep it within the passband of the crystal filter.

1251. Re: [mkars80] Re: Tune-Up Control

Yahoo group: mkars80
Date: 2009-10-25 22:06:31 UTC
From: Ron Vingerling
Topic: 1198 Message: 1251

Hi Steve et al,

I use an automatic antenna tuner that needs only a few watts during a few seconds to find a match. Therefore, I did not bother too much about the purity of this modulation and overdriving the PA. The splatter issue, if thee is one, should not be too big with only five watts PEP. This method is not much worse than a strong whistle in the mike, I thought. I listened to my own signal on another receiver whilst tuning up and it seemed allright.

BTW, is the any news about an MKARS40?

Thanks for the new FET Steve. Have rewound and replaced T2, the FET and the preset. The RX is much more sensitive now and the FET actually gets hot on TX (the old one didn't). It is drawing around 120mA RX, 300mA TX with R2 set fully anticlockwise and adjusted to 350mA. On TX with the sidetone from the CW adaptor it draws between 600 - 850mA. I can hear the signal OK in my TenTec RX. It still does not register much on my power meter, but I am beginning to suspect the meter itself, as it was very cheap and behaves quite strangely.

Thanks again

Storm

Storm,

I would expect to see over 1 Amp when whistleing into the microphone,
I think you still have a small problem somewhere.

1254. MKARS80 just completed

Yahoo group: mkars80
Date: 2009-10-26 20:46:53 UTC
From: m5zzr@btinternet.com
Topic: 1254 Message: 1254

Hi group.
This is my first post (second attempt though).

I have just completed my kit. I chose to build mine in a larger Eddystone case. I used an SO-239 socket for the antenna output, connected to the PCB with 3cm solid copper wire. I used a standard Fosters 8 pin microphone input socket wired as in Icom transceivers. The wires from the PCB to the microphone socket have been wrapped around a ferrite core situated close to the PCB. The wires to the speaker socket are also wrapped around a ferrite core.

Initial tests seemed positive. The BFO was adjusted at C38 for a frequency of 10.000MHz. The PA bias was adjusted for a 50mA rise on key down, no mod. Final current 315mA. On checking the mixer balance there appeared to be almost no output power on key down with no mod into a 2 watt meter and dummy load. Adjustments to R59 and C103 seemed to have little or no effect. This didn't bother me at this stage as the apparent objective was to zero the output. I have so far tested the transceiver with a number of Icom electret microphones and a dynamic microphone with a DC blocking capacitor installed. Acceptable output power is achieved into a watt meter around 5 watts on a whistle. The receive is very sensitive and on frequency. Transmit audio is apparent on the speaker. Audio into the microphone even comes over the speaker when the PTT is not engaged, albeit to a greatly reduced extent. I have tried calling a number of stations and, so far, not been heard. I have even run the transceiver through a linear producing 150 watts - still no contacts yet. When monitoring my transmit audio on a second receiver, the audio quality is very poor. A whistle sounds like a whistle with a pea in it.

Does anyone have any ideas? They would be very much appreciated.
Thanks. Mel. M5ZZR.

Mel,

When you transmit does the LED go out completely, not at all or does it flicker? Working correctly it should flicker off as you speak.

Topic: 1198 Message: 1256

Evening Ron,
I'm OK with your tune up method, I too whistle loudly so probably just as bad as an oscillator!

I didn't do any more with the MKARS40, it receives well and transmits a clean enough signal but I couldn't easily get rid of the thump through the speaker between TX / RX transitions. The thump was due to increasing the audio gain and using an AF gain control.

Hi Steve.
Thanks for the quick response. First the good news. I've just managed 2 QSOs R3 & S7 in cambridge and again in the Isle of Mann, from Kent, that's barefoot. So we are working. Regarding the modulation LED, I can just get it to flicker if I really shout, is that good enough? Thanks again. Mel. M5ZZR.

Mel,

You have a problem! The LED will normally flicker off with normal speech 3 - 9" from the microphone. First suggestion is to check that all the transformer windings (those wound on the two hole ferrites) are properly soldered, the most common failing is that the enamel on one of these thin wires hasn't soldered through - use a hot iron.

Best of luck.

Steve G6ALU

Steve,

Brilliant! I went around all the inductors and transformers with the soldering iron and there was no change at first so I turned the iron up to 480c and gave them all a good bubble. The LED sprung to life and I got through terrible QRN on my first call to manchester at R4 S4 with good audio reports.

When setting up the mixer balance I just get a quick jump of a few milliwatts at key down, I've set it at what appears to be the smallest jump but adjustment doesn't seem to make a lot of difference in this respect. While monitoring on another receiver I've adjusted R59 C103 for what appears to be the best audio although it's not easy on a nearby receiver. However the audio report was 'good if a little toppy'. I'm happy with that for now. This radio is great fun. Thanks.
Mel. M5ZZR.

Fine Steve, I am glad you approve of this method. Meanwhile, I have looked at the wave form produced by this oscillator. It is kind of sawtooth-shaped. Speaking of signal purity, hi. I started using it during an experiment when I was too lazy to build a proper RC sinewave oscillator and almost had sore lips from extended whistling.

I do hope you will find the time to pursue the MKARS40. From what I read in your message I get he impression that the job is almost finished. Maybe you could post your mods some time?

1262. MKARS 40?

Yahoo group: mkars80
Date: 2009-10-28 23:13:19 UTC
From: jonpoint@ymail.com
Topic: 1262 Message: 1262

Hi All,

Just assembling a kit right now (in a somewhat altered form with a steel transport case + battery + antenna tuner). I discussed with Steve Drury the concept of a 40m version but he said there were 'issues'.

I have heard some comments regarding this but can someone bring me up to date on this please? I am happy to contribute in any way I can.

I have nothing against the 80m version, and have built a homebrew portable TRX for 160 & 80 in the past, but here in Australia, 40m offers a wider operating window, with 80m only really useful at night - and that's with no storms around! The S9+ lightning crashes on 80 (&160) often preclude any communications, whereas on 40m they are more tolerable.

As I want to use the MKARS radio when camping, 40m would allow daytime operation ;-)

1267. Re: UPDATE & sound quality

Yahoo group: mkars80
Date: 2009-10-30 03:43:28 UTC
From: jonpoint@ymail.com
Topic: 1263 Message: 1267

In reality, the MKARS80 would be capable of <better> audio than many transceivers. The reason is simple - there is little processing, and with good mike procedure and a quiet shack, the sound will be more open and clearer.

The MKARS80 could benefit from a small amount of compression, to lift the average voice level a bit. 6dB of compression is almost an S-point, give or take a bit ;-)

For my 2p worth, I am investigating an ALC cicuit, driven from the "mod" LED, to attenuate the mike's output. The control element in mind is quite non-linear above 60mV, so we cannot attenuate the preamp output without distortion :-(

I will need to play with the timing, but it looks OK - I just have to adapt the idea to the cicuit without complicating things too much.

The same concept <could> work for receiver AGC. Again, the trick is to get the timing right, so as not to make the operation too noticeable. After all, this is the beauty of simple equipment - clarity ;-)

More on this when I get a bit further.

BTW, the kit went together like a charm and, apart from 2 missed solder joints, seems to work on recieve quite well. I'll post my findings as I obtain them!

Regards,

Jon Point

Hi Steve

I have just fitted the mod caps you kindly sent me and the drift problem is now history. However when refitting the board to the case I noticed that the solder joints to Q1 were loose and so I reflowed them using a larger iron. Now when I transmit the led stays on, I can hear my voice in the speaker and there is no rf output. The voltages on Q1 measure ok. Have I damaged Q1?

Dave,

Not too sure if re-soldering caused the problem, when you say "loose" was the track broken to the transistor legs or perhaps the transistor legs themselves have broken. Inspect it carefully, if you need a new transistor please email me your address and I will put one in the post.

Hi Steve

I have just fitted the mod caps you kindly sent me and the drift problem is now history. However when refitting the board to the case I noticed that the solder joints to Q1 were loose and so I reflowed them using a larger iron. Now when I transmit the led stays on, I can hear my voice in the speaker and there is no rf output. The voltages on Q1 measure ok. Have I damaged Q1?

Regards

Dave,

Not too sure if re-soldering caused the problem, when you say "loose" was the track broken to the transistor legs or perhaps the transistor legs themselves have broken. Inspect it carefully, if you need a new transistor please email me your address and I will put one in the post.

From: g3gja.g8eqz
Topic: 1271 Message: 1271

Hi Steve

I use a Sigma CMH50 headphone / boom microphone intended for computers with the MKARS80 and I find I need to nearly swllow the foam blob surrounding the electret element to get the LED to extinguish. I've tried a couple of different electret mike with little improvement.

Can you give me an idea of what pk-pk audio level I should expect on the emmitter of Q4 to cause the LED to go out please? That might give me an idea as whether I have a lot of low output mikes, low gain mike amp or low gain tx chain. Ido get 5w PEP with a loud whistle and it draws about 1.3A max.

Having said that I worked a GI, 2 x GM, 2 x ON, 1 x DL and 1 x PA in the CQWW SSB contest weekend before last from Sherwood Forest using a 10m vertical!

Clive,

I've never measured it but I often have complaints that the microphone amplifier is too sensitive!

That answer sounded like I didn't care so I've measured it - on my MKARS80 to make the LED flicker off requires about 0.5-1V P-P at the emitter of Q4.

If the level is similar when speaking normally please check the soldering of all the transformers!!

From: g3gja.g8eqz
Topic: 1271 Message: 1273

Thanks for taking the time to measure your rig Steve; it's helped me loads; I put a 1kHz tone into my unit and increased the level until the supply current stopped increasing at 1.3A and then backed it off a little so that the LED was just illuminating which was at 1.2A.

I then measured the pk-pk level of the tone on Q4's emitter and got 240mV.

So it looks as though the TX chain is OK and I'm now looking at the mike amp (the circuit should have a gain of 6x from Q2 base to Q4 emitter)and the possibility I've got a load of duff mikes!

Thanks for your help

Subject: Re: [mkars80] problem

Dave,

Not too sure if re-soldering caused the problem, when you say "loose" was the track broken to the transistor legs or perhaps the transistor legs themselves have broken. Inspect it carefully, if you need a new transistor please email me your address and I will put one in the post.

Regards,
Steve G6ALU

Hi Steve

I have just fitted the mod caps you kindly sent me and the drift problem is now history. However when refitting the board to the case I noticed that the solder joints to Q1 were loose and so I reflowed them using a larger iron. Now when I transmit the led stays on, I can hear my voice in the speaker and there is no rf output. The voltages on Q1 measure ok. Have I damaged Q1?

Regards

Hello David,

We should be on this Sunday, 3.690MHz @ 9:30 UTC as long as it hasn't been pinched by the other nets!

I will be up early on Sunday so if any one wants to try earlier (7:30 UTC onwards) please let me know. We had quite a few on last week's net but all sufered from QRM.

1281. MKARS80 DX-ing

Yahoo group: mkars80
Date: 2009-11-06 19:47:51 UTC
From: pa0rcl
Topic: 1281 Message: 1281

Hi all,

Tonight I made a short QSO with OX3KQ on 3799.5 using one of my MKARS80's at 10 Watts output power. My antenna was a horizontal deltaloop at 8m height and 60 m in circumference. I was given a report of 58!Distance spanned was about 2500 kilometers and OX3KQ used 1 kW and a full size vertical. This was real fun, working Greenland with not even 100 Pounds worth of equipment against many thousands!
Are there similar stories from any of us?

73 and good DX

Hello David,

We should be on this Sunday, 3.690MHz @ 9:30 UTC as long as it hasn't been pinched by the other nets!

I will be up early on Sunday so if any one wants to try earlier (7:30 UTC onwards) please let me know. We had quite a few on last week's net but all sufered from QRM.

Regards,
Steve G6ALU

Steve

No I repaired the leg of the device. It's now back in its box and been on air this evening. I hope to be on the net on Sunday if it is on.

Thanks again

Dave G0BVV

Hi Steve

On closer inspection I found one of the legs of Q1 had fractured, probably when I removed the pcb from the case.
Thanks for your promp and helpful advice.

Regards

Dave G0BVV

Dave,

Not too sure if re-soldering caused the problem, when you say "loose" was the track broken to the transistor legs or perhaps the transistor legs themselves have broken. Inspect it carefully, if you need a new transistor please email me your address and I will put one in the post.

Regards,
Steve G6ALU

Hi Steve

I have just fitted the mod caps you kindly sent me and the drift problem is now history. However when refitting the board to the case I noticed that the solder joints to Q1 were loose and so I reflowed them using a larger iron. Now when I transmit the led stays on, I can hear my voice in the speaker and there is no rf output. The voltages on Q1 measure ok. Have I damaged Q1?

Regards

1296. Re: [mkars80] Re: net

Yahoo group: mkars80
Date: 2009-11-08 08:05:43 UTC
From: Ron Vingerling
Topic: 1263 Message: 1296

Unfortunately I lost you guys because of heavy QRM from various contests on the continent. Anyway, I have added another international MKARS80 to the log, Steve, and with 50 and 5 Watts this time. Thanks, enjoy the net on 3720.

73 Ron pa0rcl

Yahoo! Groups Links

[Non-text portions of this message have been removed]

1297. Re: [mkars80] net

Yahoo group: mkars80
Date: 2009-11-08 08:06:45 UTC
From: John Housego
Topic: 1263 Message: 1297

Nice to make the early bird "MKARS80" net this morning!

G6ALU Steve 53
2E0JMK Mark 54
G0BVV 52
G4MDR Alan 58
G3ZPA Dave 59
G1AOZ Jim 54
PA0RCL Ron 54

Thanks chaps

John (M0TIF)

[Non-text portions of this message have been removed]

1298. Re: [mkars80] Re: net

Yahoo group: mkars80
Date: 2009-11-08 08:08:09 UTC
From: Steve Drury
Topic: 1263 Message: 1298

Bad QRM on 3.690 so we moved to 3.7198, conditions a little better with the following calls heard;

2E0JMK
G4MDR
G3ZPA - Dave, Comercial radio 10W
G1AOZ
M0TIF
PA0RCL - Ron, MKARS80 with 50W PA

Will try it again at 9:30 UTC on 3.690MHz as usual.

Steve G6ALU

Hi Steve

Where are you now? 3.719 & 3.691 seem to be full

Hi Steve

Where are you now? 3.719 & 3.691 seem to be full

1302. RE: [mkars80] net

Yahoo group: mkars80
Date: 2009-11-08 09:05:11 UTC
From: David White
Topic: 1263 Message: 1302

just to confirm that everyone on 3.690 was readability 5 and when going to 3.719 again all signals readability 5 the strongest was steve ALU at 5/8 the weakest was john TIF at 5/5. i think the advantage for me is having an extremely low aerial which is 110 feet long and 9 feet high tapering down to 5 foot high at the front hedge. but i was running just over 10 watts which is double what you guys were using. when i went over to my very high aerial (a Zepp at 55 feet high) i could not read anyone due to the massive QRM. even jim from cumbria was fully readable. this is the first time i have listened to all these MKARS80 rigs and they all have superb modulation. de G3ZPA

From: DAVID CLENCH
Topic: 1263 Message: 1303

9:30 net conditions much worse. Very strong station LF of 3.690. At 09:50 an OZ station started calling cq so I hung up my headphones. Called in a couple of times but was not heard. I heard G6ALU/G4MDR/G8JWT/G3GJA but all were very much down on the 07:30 net.

Unfortunately I lost you guys because of heavy QRM from various contests on the continent. Anyway, I have added another international MKARS80 to the log, Steve, and with 50 and 5 Watts this time. Thanks, enjoy the net on 3720.

From: JIM HENDERSON
Topic: 1263 Message: 1304

9.30 net conditions very poor this end could just about make out under the noise, ended up listening to the station LF of the freq who later QSYd because he was getting interferance from a lot of QRP stations on 3690 and did not understand why they were on that freq.
May be the RSGB should be contacted and asked if they could push the fact that 3690 is the center of th QRP section of the band.
As Sunday is the busiest time on 80mt perhaps a net one evening in the week would be better.

9:30 net conditions much worse. Very strong station LF of 3.690. At 09:50 an OZ station started calling cq so I hung up my headphones. Called in a couple of times but was not heard. I heard G6ALU/G4MDR/ G8JWT/G3GJA but all were very much down on the 07:30 net.

Unfortunately I lost you guys because of heavy QRM from various contests on the continent. Anyway, I have added another international MKARS80 to the log, Steve, and with 50 and 5 Watts this time. Thanks, enjoy the net on 3720.

Hi guys.

Tried to listen for you on the net this morning, but nothing :(

On the other hand i worked a bunch of contest stations last night with my Mkars80, so i guess it would be nice to give it a try after the sun goes down :)

Anyone on at 20:00 UTC ? I will be on 3690+ - QRM

SA3AZK / Mike

From: Clive Reynolds
Topic: 1263 Message: 1306

Hi Steve

I've noticed an odd quirk with my kit when tuned to 3.775MHz +/- 1kHz.

It takes longer for the huff n puff to lock up than usual when initially setting the frequency.

It only stays locked for a few seconds and may take up to 20 seconds to lock again. There are no - bars displayed before it unlocks; it goes straight to the U.

It then carries on with this locked for a few seconds and then unlocked for 10 - 20 seconds cycle.

As soon as you move away from 3.774 to 3.776 it behaves normally. Doesn't make any difference where the fine tune control is if the main tuning is used to bring it back to the same range.

Firmware is v2.4. I seem to remember an earlier reference to a similar problem but I can't find the message.

Is it just mine or has anyone else seen this behaviour?

1307. MKARS80 Australian users

Yahoo group: mkars80
Date: 2009-11-10 04:03:52 UTC
From: vk2jdp
Topic: 1307 Message: 1307

I have received a couple of emails from Australian users. Are there any more out there - or even non-users just thinking about it? I would like to set up a scheduled net if possible.

Last night, the conditions were quite good on 80m, with a number of Foundation licensees (10W max) coming in at S7-S9. The longest path was ~1100km, but there were 2 Tasmanian stations (~980km) that were S9+. I know that Foundationists(!) cannot construct their own transmitters but there might be a few Standard or Advanced operators keen to form a <real> QRP net.

And yes, I know that there are already a couple of QRP nets, but they don't often run QRP except on CW. Either that, or they are all using 3 element yagis on 80m LOL

Hi Jon,

Just to let you know that I built the second one in Australia about 18 months ago.

Played with it a lot for a long time after building but it has developed a fault after I displayed it at a field day. Have tried once to fix it. Need to have another go.

I'm a member of the QRP club and used it once in a QRP contest in which I think I came second in the SSB division.

I'm in Sydney. Furtherest contact has been to Rockhampton in Qld.

Clive,

You have found a little bug in the firmware - I will get round to fixing it some day, if you use that frequency often let me know and it will be fixed sooner than later.

1310. Re: [mkars80] net

Yahoo group: mkars80
Date: 2009-11-10 11:48:46 UTC
From: Clive Reynolds
Topic: 1263 Message: 1310

Ok Steve, if they all do it I can live with it and wait for the next revision as I don't use that frequency regularly.

Thanks

Clive G3GJA

Clive,

You have found a little bug in the firmware - I will get round to fixing it some day, if you use that frequency often let me know and it will be fixed sooner than later.

Hi Steve

I've noticed an odd quirk with my kit when tuned to 3.775MHz +/- 1kHz.

It takes longer for the huff n puff to lock up than usual when initially setting the frequency.

It only stays locked for a few seconds and may take up to 20 seconds to lock again. There are no - bars displayed before it unlocks; it goes straight to the U.

It then carries on with this locked for a few seconds and then unlocked for 10 - 20 seconds cycle.

As soon as you move away from 3.774 to 3.776 it behaves normally. Doesn't make any difference where the fine tune control is if the main tuning is used to bring it back to the same range.

Firmware is v2.4. I seem to remember an earlier reference to a similar problem but I can't find the message.

Is it just mine or has anyone else seen this behaviour?

1311. Buzzing when transmitting

Yahoo group: mkars80
Date: 2009-11-12 23:47:06 UTC
From: yaesu85
Topic: 1311 Message: 1311

This is my first SSB kit I have built but have built many CW transceivers. I finished building the kit last week and finished aligning the radio last night. I am able to receive very well across the entire 80m band but I am having issues transmitting. I have set up my FT-450 to monitor the transmission of the MKARS80 but all I hear is a buzzing sound, similar to a CW signal. I have measured the vfo and bfo and both are good. I used an oscilloscope and freq counter to verify the VFO and BFO. I used to O-scope to observe my transmit signal and I have a sine wave at the correct transmit frequency. I have never looked at a SSB signal during transmit but I thought the sine wave would change in response to my voice? I also adjusted the mixer balance R59 and c103 by observing the S-Meter on my FT-450 while the PTT and microphone connections were grounded for the lowest setting.
I had a dynamic microphone available so I removed r17 to use it. ALl of the transmitting has been into either a 50ohm dummy load or my dipole.
I adjusted the band pass filter so it looks like the picture but I was wondering if it should be done a different way?
I have also performed a visual inspection of all components and for any other obvious imperfections.

Does anyone have an idea of where I could start looking?

1313. Buzzing when transmitting sounds like oscillation

Yahoo group: mkars80
Date: 2009-11-13 04:21:45 UTC
From: vk2jdp
Topic: 1311 Message: 1313

You may have a stability problem. Before you can null the carrier, you need to adjust the PA bias.

Once I tried to set the bias, the PA oscillated because my layout put my antenna tuner near the bandpass filter. A small piece of PCB as a shield fixed it. Before I fixed the oscillation, any attempt to set the PA bias resulted in oscillation, as soon as the mosfet's conduction threshold was reached :-(

If you monitor the MK' on your other rig, tune-in to the MK's carrier to get a 800Hz-1.5kHz tone in the receiver and adjust the bal mod for minimum signal. If this doesn't help, you may have another problem.

If you monitor the waveform on a CRO with a fast timebase (50ns), you should a sinewave proportional in amplitude to the signal into the mic. No mic signal should equal no sinewave (or a very small one). If you slow the timebase down to 1ms, you should see the voice envelope.

Hope this helps ;-)

Regards,

Jonathan Point

From: Steve Drury
Topic: 1311 Message: 1314

If you are using a "standard" setup with the box supplied you shouldn't get any instability with it correctly aligned - one time I did notice this though was when the BFO was set to the filter centre frequency but you have set this correctly at 10.000MHz?

You should be able to get a good null certainly less than 100mV of waveform on the drain of the output transistor, if it isn't possible to achieve this check that the mixer transformers are soldered correctly and if still a problem check the diodes are OK and the transformer is wound correctly.

Make sure you are using a screened microphone lead with the braid grounded also that your output coax is correctly terminated. When setting the bias and mixer ballance you can use an unused mono jack plug in the microphone socket, this shorts out the microphone and puts it into TX.

Can you hear anything from the loudspeaker when transmitting?

I can't think of anything else at the moment.

Steve G6ALU

1315. ANOTHER MKARS 80 ON AIR

Yahoo group: mkars80
Date: 2009-11-13 23:26:56 UTC
From: g4pqp
Topic: 1315 Message: 1315

I have finally finished and boxed up my MKARS 80 . I followed Steve's constriction procedure to the letter and the project went together without a hitch , worked first time . The finished item looks very professional thanks to the drilling templates and panel overlays . Received audio is excellent and I have received many complements regarding the modulation (using electret mic) . O/P is 7 watts @ 3.600 MHz into a good 50 ohm match (5 Watts minimum at the top end of the band) I have worked many stations in the U.K and Europe . I have received some very good reports with my homebrew A.T.U. and homebrew G5RV which is up at 70 feet . So to sum it up , what can I say ?. Such an excellent kit . It has just the right mix of simplicity and complexity to make it realistically reproducible and a practical project for the average constructor .In operation it is TRULLY REMARKABLE, very stable and easy to use . The L.C.D. frequency readout adds real professionalism and is something one would only usually find in commercial equipment costing a good deal more money than this kit . It is extremely good value for money and does everything and more than it says on the tin . I have found the project to be very rewarding both in the construction of the kit and in the fact that I can go on air with a homebrew station . Reading through the postings on this site it seems that the main factor for the kit not working first time is possibly due to bad / dry joints on the transformers which use very fine EC wire . I would suggest that it is worthwhile to check the continuity of each winding as you solder the transformers in . Personally I am not happy with using lead free solder . I like to use good quality lead tin alloy 0.7mm multicore . I look forward to meeting you all on the Sunday morning nets when time allows (3.690 around 0900 hrs) . Finally thank you to Steve G6ALU for his hard work in the design ,development and backup with this remarkable kit . Wouldn't a kit for a matching linear amp be so good , nudge ,nudge , wink , wink . !!!!! 73`s to one and all , de Phil (G4PQPP) , Cromer Norfolk .

Thanks for the comments Phil, we like happy customers!

The Sunday morning net is normally around 9:30 AM, I will listen out for
you.
Steve G6ALU

1317. Another MKARS80 on-air downunder

Yahoo group: mkars80
Date: 2009-11-15 12:12:12 UTC
From: vk2jdp
Topic: 1317 Message: 1317

Steve,

Just a quick note to thank you for producing this wonderful radio. As you can see from the photos, I didn't end up using the supplied case, but built it into a self-contained portable unit, together with a tuneup oscillator, an antenna tuner and an LED SWR unit. Just have to make the battery bracket for the 12V 9ah battery and it's portable!

First QSO last night over a short range of 300km with an S9+20dB signal! The QSO lasted nearly 2 hours before I went to bed. Lots of fun ;-)

Looking forward to many enjoyable evenings through (our) summer.

Best wishes and 73s to Val and yourself,

Jon Point
VK2JDP

As I have built two MKARS80 already, I am thinking about modyfy one of them to 40 -or even better 60m .The Norwegian tele administration have given us the posibility to use 60m as a normal secondary status band.
So please send me a few word and perhaps a scematic of what was needed for 40m modification.

Topic: 1319 Message: 1319

A relatively quite band allowed us to have a very successful sched this morning, there were a total of 14 MKARS80s, all but one were QRP. Thanks should go to ON65L for vacating the frequency when I asked him to! Towards the end band conditions improved and all stations were heard Q5.

Stations worked:

G3ZSV - Glyn, Plymouth
G4MDR - Alan, Newport Pagnell
M1EEL - Mick, Erith
G3GJA - Clive, Hull
G4PQP - Phil, Cromer
M0JVW - John, Between Liverpool and Manchester
G4OZG - Ted, Kings Lynn
G3UD - Graham, Stoke on Trent
G4DSV - Duncan, Mansfield
G4NJJ - Peter, Kings Lynn
M1CXK - Alan, Dartford
G0IJU - Peter, Kings Lynn
G4VLL - Chris, Marlow
G6ALU - Steve, Milton Keynes

Its not often you hear 14 transceivers all of the same design on a net, least of all when they have been home built.

The net lasted over an hour!

Steve G6ALU

Yes , very successful net Steve . As you pointed out, not often you hear 14 transceiver all of the same design and home built on the same frequency. They all sounded very good and most were Q5 for much of the time here with me near Cromer . Some QRM and QSB from time to time . Thank you for running the net . It was nice to get reports from around the country and make some new acquaintances . I was called by Allan, M1CXK in Dartford after the net . It was nice to compare notes . I await his e-mail to arrange further contacts in the near future . Thank you all for taking part , it was a pleasure talking to you . 73`s de Phil G4PQP/ G8NXI .

1324. MKARS80 on-air downunder - fine-tune knob position.

Yahoo group: mkars80
Date: 2009-11-16 01:10:38 UTC
From: vk2jdp
Topic: 1317 Message: 1324

Why did I move the fine-tune knob (someone asked...)?

Because it is close to the main tuning knob and I bumped it a few times in the original position (fumble fingers!). It attaches to the front panel and is wired to the PCB. Photos of the complete unit, in the case, will be posted once it it painted. Currently being zinc plated.

Regards,

Jon Point

Hi all ,

I am very pleased to report that I had my first transatlantic QSO with my MKARS 80 tonight . It was with John , W2VP from New York . I was very impressed by the receiver performance in as much as it resolved the weaker signal in spite of very strong co channel interference from European stations.

Nice one, Phil!

I too have worked W2PV but it was on 40m with 100W. He packs a good signal. Good work ;-)

Hi Guys , thank you for your interest and replies . I should of course have mentioned my antenna set-up. Well nothing special , a G5RV @ 70 feet . I am lucky enough to be in a rural location and get the antenna well in the clear . Also I am blessed with an electrically quite location . I was just lucky enough to be in the right place at the right time with perfect conditions to make the contact. Of course it was mainly down to John`s (W2VP) excellent station . Full size four square and 800 watts. Never the less I am very impressed with the MKARS 80 in as much as I was hearing other State side stations who were running 100 watts to a dipole .
73`s de Phil.

Thanks Phill, well that's great, well done, I thought you would say you
were using an enormous beam so it gives hope for the likes of me making
similar MKARS80 DX contact one day!

Yes indeed John , just a modest antenna system here .As I said its more a case of good conditions and being in the right place at the right time . It took a little patience to make the brief contact , almost 2 hours but it was worth the wait . Report for me was 4 & 4. Not a rag chew QSO by any means but it was a good contact . At the end of the day I think Steve , G6ALU deserves the credit for sharing his experience and giving us all the opportunity to build and use this fantastic little transceiver .

73`s De Phil G4PQP .

From: Adrian Rees (MW1LCR)
Topic: 1325 Message: 1334

Hello everyone,

I'll be on 3690KHz tonight for an hour or so, with my MKARS80 if anyone wants a cat.

Also, Steve were did you get the knobs used in the kit ? I could do with another tuning knob sized one, for another project I am building. If you could ley me know that would be good.

Thanks

Adrian MW1LCR

Adrian, I was not aware that Steve supplied knobs with the MKARS80 kit, although he does include some small ones with the CW adapter. Please go to the photo section of this group and look at some builds by members and choose a knob which you like and tell me whose album and jpg it is depicted in, and I should be able to identify the knob and a source for you. 73 de Charles G3OTH

Hello Alan,

Maplin do the range of knobs

Fluted range
Type K7A order nr YX01B
Type K7B order ny YX02C
Type K7C order nr YX03D

this link "should" take you to the Maplin page....

http://www.maplin.co.uk/Search.aspx?criteria=knobs&source=15

I supply knobs as an optional extra, I didn't when I first sold the radio.
They are available from Rapid (www.rapidonline.co.uk) but be warned they
have a carriage charge on all orders below ?30.

Hi Steve
Thanks for this.

I have a homebrew spectrum analyser adapter (like the the poor mans spectrum analyser from RadCom) and I have lost a knob from it. (I bought it at Elvaston Castle about 4 or 5 years ago). It just so happens to use the same knob set as the MKARS80. Hence the question.

Regards

Adrian

From: Steve Drury
Topic: 1343 Message: 1343

I won't be able to be "net controller" this Sunday as I'm being treated to a birthday breakfast, would some one else like to take over the hot seat for a week? Its a pity to let the net drop after last weeks success.

Enjoy your birthday Steve

I hope to be on the net on Sunday but am not best placed to be net controller as I am on the south coast. I will be listening/calling from 09:30.

Dave G0BVV Bracklesham Bay, West Sussex.

Hi all

Tried calling in to the net this morning but deep qsb a problem. Will try again next week. G4MDR was 59+ at times down here in Bracklesham Bay.

Will try again next Sunday

1350. Re: Sunday's sched

Yahoo group: mkars80
Date: 2009-11-22 15:55:21 UTC
From: tedg4ozg
Topic: 1343 Message: 1350

Happy Birthday Steve.

I listened on 3.690 from just before 9.30 and managed to work various MKARS80 users before 10.00 when I was called away.

G3WDL Stuart. nr Doncaster
G8JWT Roger. Newport Pagnal
G4MDR Alan. Also N P
G4NJJ Peter. Kings Lynn
G0WKN Ken. Long Sutton, Lincs
G3GJA Clive. Hull
G3UD Graham. Stoke
G7HSA Adrian. Ludlow

I also heard G0BVV and some other stations very much in the QRM and noise but unable to work them, QSB was also a problem as are my cloth ears! Many thanks to all for being on, perhaps better conditions next week.

Ted G4OZG Kings Lynn, with quite low 80/40 trap dipole.

Hi Steve,

On a number of MKARS80 Sunday nets there is generally some QRO QSO's within a few KHz of 3.690 that have caused problems at my end when attempting to resolve the weaker signals of other net members.

This I attribute to the likely desensitising of the front end of my transceiver. Frequencies around 3.690 seem popular for other Sunday morning nets, so perhaps ours isn't such a good choice of frequency for QRP after all.

Maybe our members could listen around 80m at roughly the same time (9.30-10.00) each day and noting which frequencies are generally clear, and draw up a list of favourable ones, and have a vote to see which one suits the majority?

1362. Some new videos from Len

Yahoo group: mkars80
Date: 2009-11-30 19:15:29 UTC
From: g3oth
Topic: 1362 Message: 1362

Hi,

Len KC0WOX has just posted some details of some new videos he has made for the BITX20 group which I thought would be of interest to MKARS80 members, particularly the part regarding shape of the BITX20 ver.3, 10MHz Xtal Filter which is similar in design to Steves.

The first one,
http://golddredgervideo.com/kc0wox/networkanalyzer/networkanalyzersbasicspart1.w\
mv

goes through a few basics on a network analyzer and then runs some test measurements on a WA2EBY amplifier lowpass filter board.

It is 166 meg in size and 16 minutes long.

The second one

http://golddredgervideo.com/kc0wox/networkanalyzer/bitx20akitfilters.wmv

runs tests on the lowpass filter, bandpass filter, and crystal filter on a bitx20a kit. It is 89 meg in size and about 8 minutes long.

He will add some more video on the crystal filters later as he is just learning how to get the best test results.

There will be a 3rd video in the series as soon as he gets it edited on the same filters in a bitx version 3 board.

I would recommend watching the first one first as it explains the basic setup and how the measurements are made.

1363. Illumination of a digital scale. How to include?

Yahoo group: mkars80
Date: 2009-12-01 20:19:04 UTC
From: Konstantin
Topic: 1363 Message: 1363

Hi Steve, hi all.
I am very glad, that you have accepted me in group!
Very much I wish to make illumination of a digital scale. Show please where the manual for a digital scale lays? I still can involve what latent functions?
Thanks!

Best regards,
Konstantin V. Enin (RN3ZF)

1364. Effect of B.F.O. on filter freq ??.

Yahoo group: mkars80
Date: 2009-12-04 13:10:01 UTC
From: g4pqp
Topic: 1364 Message: 1364

I noticed a post some time ago in reply to a station having TX problems (buzzing on TX) . Steve suggested that the problem could be due to the B.F.O. sitting exactly on the filter frequency .

I had a similar problem some time ago . Symptoms were that the receiver went very quiet and there was about 3 watts showing on T.X without any mod, mod led was not illuminated. When I monitored the T.X. frequency on my ICOM746 there was no carrier of funny noises , just an extremely weak signal when I whistled into the mic . After some while the fault disappeared of its own accord . I didn't even remove the case .

The kit had been working for some time without a hitch . The weather had been extremely mild then suddenly turned very cold . I have an outside shack . My theory is that perhaps due to the low temperature the B.F.O. was siting on the filter frequency and gradually drifted H.F. when the crystal / associated components reached temperature . As is my normal practice In the winter months I have switched on the 1.8Kw night-storage heater which is set to minimum and runs for 4 over night on off peak rate just to take the chill of.

Just wondering if anyone else has had a similar experience ?. If the fault occurs again I will monitor the B.F.O. frequency with my frequency counter from switch on and watch it as the set comes up to temperature.

Thank you for your interest , 73`s de Phil .

1365. MKARS80->MKARS160

I investigate a variant of updating of the transceiver on a range of 160 metres. Whether it is possible to add in the scheme a range of 160 metres not changing a microcontroller insertion?

Thanks!

Hi Konstantin,

The micro program should be OK although I have not tested it on 160M, the bigesr problem will be the VFO frequency; to tune 18.-2.0MHz the VFO will have to tune 8.8-8MHz which may be too high to have good stability.

Regards,
Steve G6ALU

From: g4pqp
Topic: 1369 Message: 1369

Hi Steve ,
I was looking at the G QRP CLUB website recently and thought that the MKARS 80 kit would be of interest to its members. I sent a quick e-mail to George Dobbs G3RJV who has been running the club for many years .His reply below ..

73`s de Phil .

Hello Philip
Good to hear from you.
I had heard of the MKARS-80
but not looked at the webpage.
A very useful kit.
I will contact them about a mention in SPRAT
and perhaps my RadCom page.
Although the winter SPRAT is now with the printer.
Thanks
George
.

Hi John

Conditions were noisy on the net this morning. There were stations above & below 3.690. I scribbled down G6ALU/G8DIU/G8JWT/G0WKN/G4MDR/M0TZ0 & DA6TEC on the net but could not make myself heard. Never mind there is always next week.

Someone did suggest trying an evening net. Is anyone up for it?

Regards to all

From: Steve Drury
Topic: 1370 Message: 1372

Hello David,
You were heard as I have you in my log but I don't think you could hear us when we returned to you.

My list is as follows:

G8DIU - Brian, Esher
G8JWT - Roger, Stoke Goldington Bucks.
G0WKN - Ken, Long Sutton
G4MDR - Alan, Newport Pagnell
DA6TEC - Carl, Germany (sorry don't remember where abouts) Running a Ten-Tec on 5/20W
G0BVV - Dave, heard but not "worked"
G3GJA - Clive, Hull
G3UD - Graham, Soke on Trent
M0TZO/P - Paul, Banstead

G0AIJ was heard (this may have been M0AIJ) but not worked.

Lets hope the conditions are better next week.

Following the net I looked for a free frequency, there was one at 3.650MHz but I know this is a popular frequency in the morning so the chance of it being free next week is slight; if you don't hear us on 3.690MHz go and have a listen on 3.650MHz just in case we are there!

Steve G6ALU

From: Steve Drury
Topic: 1369 Message: 1373

Hi Phil,
I'm a member of the G-QRP club - others have suggested advertising it in Sprat or offering it as an article.

I haven't "pushed" the MKARS80 - earlier in the year RADCOM wanted to do an article, quite surprising really as the project is now over 2 years old!

The plan is to get a few diferent kits on the market before we become too "known".

Regards,
Steve G6ALU

Paul,

Congratulations Paul!

Just a note however, the rig seems to to be locking to frequency OK (as evidenced by you having to turn the fine-tune a long way before anything happens) but the lock indicator (+) doesn't seem to show on the display???

Am I missing something?

Regards,
Jon

Hi
You dont need an oscilloscope to build or commission this kit.
Although they are always a useful addition to the shack if you have one.
All you really need is a small 15 watt or thereabouts soldering iron and bit, a supply of small guage solder, a good pair of cutters (Swedish Steel...you know all about that I guess), preferably access to a cheap $10 multimeter and a nice magnifying glass or magnifier. The build instructions are very detailed and superb, just remember to read them as you work and take your time and check everything as you go.
Most people manage to get their kits to work first time if they have payed careful attention to their soldering and carefully inspected their joints for continuity and for any bridging or non wetting as they went along.
Its a great kit, treat yourself for Christmas, you will not regret it.

1380. Low Band Contest this weekend.

Yahoo group: mkars80
Date: 2009-12-08 17:49:55 UTC
From: Adrian Rees
Topic: 1380 Message: 1380

Off topic, and apologies....but.

This weekend is the UBA (Belgian) Low band contest (160-80-40m) on Saturday & Sunday. 3 hours each day. The Sunday morning slot is 0600 - 1000 so co-incides with the MKARS Sunday net. Might be an ideal time to get some nice contacts with the MKARS as this is a very relaxed contest. I guess Mr Low Band himself (ON4UN) will be on air too boot.

Info here: http://www.uba.be/sites/default/files/uploads/hf/other/uba_winter_en.pdf

Best wishes

Adrian MW1LCR

I agree with Charles but if you have a HOT soldering iron it will help with tinning of the enameled wires.

1384. Preamp for my MKARS

Yahoo group: mkars80
Date: 2009-12-09 04:51:55 UTC
From: Hasse
Topic: 1384 Message: 1384

Hi all !
I found a little preamp kit from KitsandParts.com, which i just have assembled.It`s built on a little pcb 4.5 x 3.2 cm,and i must say i was really surprised of what this little thing was doing with the signals.You can find measurement-data on his homepage.My wondering is if it`s ok to build it in to the MKARS-cabinet, between RX-out from relay to Cap-52, to avoid more relays outside the MKARS-box.Yes i know i will not be able to turn it off, but i don`t want so either.
Best 73 de SM6MPA/Hans-Göran

Thanks all for the reply on my question, it will be some time until i can buy the kit.. and maybee i have a chanse to borrow a oscilloscope whan it's time to assemble the kit.

My first radio i brought was an FT817, and i realy like the QRP thing... soo i realy hope i can get this soon and get out on 80 Meters again =)

/M

You really don't need a CRO to complete the MKARS80 and get it on-air. As Steve said, you will need a fairly fine, HOT (~50W) soldering iron to relaibly tin and solder the inductors, but you would only need an oscilloscope if something was very wrong.

I have built a few transceivers over time, all home-brew. In these cases, a CRO was necessary as was I designing as I went. With the MKARS80, I thought 'I'll just BUILD it and see what happens'. My only problem was of my own doing, as I had mounted the PCB into a different enclosure. I cured the problem using common sense.

Only when I had it working on the bench did I bother to connect the CRO to look at the output - and it was clean-as. I needn't have bothered with the CRO...

If you want, see if you can borrow one afterwards for piece-of-mind but it is better to find a local ham that can assist you with an on-air test.

Regards,
Jon

Homebrew has a special magic, so you will find someone at your radio club willing to help you with tests, and access to test gear. Most people who see the MKARS80 want one!
It also gets the conversation at the club away from "YaeCom" black boxes back to 'real radio', so you are doing everyone a favour. <g>

Most important tip
Enjoy the build, do it over a week or so - don't rush. Do it in 'bag sessions'.
Check your work from the last bag before starting on a new one.
Use a good work light and a magnifying glass.

I've mentioned my main 'gotchas' before but here they are again for anyone new...
(A 'gotcha' is problem that you have to take time to solve, but could have been avoided!)

1. Debur (remove sharp metal) from the hole used to mount the output transistor to the case.
I had a shard that shorted the tab to the case. Soon solved once spotted though!

2. Coils and transformers.
Strip the insulation and tin prior to soldering to the board, rather than leaving the act of soldering to the board to to this for you. This makes sure that you have good electrical contact. I had connection that looked connected but wasn't!

3. Binocular Cores.
Using a drill bit chamfer the holes slightly.
It will make winding easier and reduce risk of stripping the enamel.

4. Drilling the case.
Results using a hand drill are very poor. Use a stand drill.

Did I mention...
Take your time, work in bag batches and enjoy the build.

Hi Rob,

Feel free to ask... might be worth a look in the photos section as there
have been some interesting departures from the "standard" product recently.

Hi Mark,

The cases are a range from Hammond, based in Canada, and available through Farnell :
http://uk.farnell.com/jsp/search/browse.jsp?N=1003600+8480+500006+597149+454465+570958&No=0&locale=en_UK&appliedparametrics=true&getResults=true&catalogId=&prevNValues=1003600+8480+500006+597149+454465&originalQueryURL=http%3A%2F%2Fuk.farnell.com%2Fjsp%2Fsearch%2Fbrowse.jsp%3FN%3D1003600%2B8480%2B500006%26No%3D0%26getResults%3Dtrue%26appliedparametrics%3Dtrue%26locale%3Den_UK%26catalogId%3D

ATU box : 31x160x160mm Hammond pt no 1455R1601, Farnell stock no 1511216

RT box ; 52x160x160mm Hammond pt no 1455T1601, Farnell stock no 1511218

They are a bit pricey, but are quite nice, I usually discard the plastic trims and fit the panels direct to the box. The boxes have internal pcb mounting slots, which are useful.

Some of the Hammond range is available from Maplin Electronics in the UK, http://www.maplin.co.uk/Module.aspx?ModuleNo=33690

and Rapid Electronics :
http://www.rapidonline.com/Tools-Fasteners-Production-Equipment/Cases/Metal-Cases/1455-Series-extruded-aluminium-enclosures-with-metal-end-panels/74372/kw/hammond

I recently received a post from another Yahoo group mentioning photos were no longer displaying, just a box. Again, they are fine when I look. This seems an odd coincidence. In case its relevant I'm copying the reply from Petra Henderson in the FRG-7 group.

" If you are using "No Script" or similar as an add-on to your browser, you need to go down to the bottom right-hand corner of your browser window (where you will see a symbol like an "S" or like a "No Parking" sign (Red crcle with diagonal strike-through) that needs to be clicked on and the services responsible for allowing the pictures to be presented "Allowed".

this includes the setting and permissions for "Yimg.com" (Yahoo Images) which s the one I think you are blocking...

This also needs you to have an up to date version of Java installed on your PC. "

John,

No problems, I will keep you informed. I have done a rough one and just have to finalise the PCB.

Mine has no VOX, it connects to the MKARS80's PTT. Saves a lot of components that way, and doesn't cut me off when I'm thinking LOL

It is designed to produce min. 25WPEP@11.5V, as it will be running from a battery. Should be good for ~40WPEP@13.8V. It has an ALC of sorts, and I was thinking of a BF998 preamp - hence why the PCB isn't done yet ;-)

Regards,
Jon

1406. Help, no TX

Yahoo group: mkars80
Date: 2009-12-20 12:31:28 UTC
From: Darren
Topic: 1406 Message: 1406

Hi all

Finally got around to having a look into the issues I have after an initial test a couple of weeks ago.

The RX side of the radio is fine, however I have no output. The modulation led lights and the relay clicks on when I press the ptt but I have no output. I'm using a proven mic so that is eliminated.

I've checked over for bad joints etc and have measured all the ic/transistor voltages. All are OK except Q9 which is reading 2v on emitter but 6v on both base and collector which is different to the troubleshooting section of the manual. I'll change this but any other suggestions?

Hi Darren,
Check the continuity between junction R32 / T3, and junction R37 / T3 / collector Q9. If not low ohms, check soldering of T3.

OK Darren,
If the base volts reads +6 and the emitter reads +2 with no mod, then either Q9 is suspect e-b o/c, or in backwards? I assume the volts reading on R32 / T3 junction is +6 also?

Yes, the R32/T3 junction is also +6v and Q9 is correct orientation.

I'll change Q9 and see where that takes me.

Thanks

Q9 base should be ~0.7V above the emitter. I assume that you are checking from the PCB copper, not the actual transistor legs. I'd check soldering for Q9 - an NPN's base cannot be 4V above the emitter! If you can get in there, check the voltage at the transistor legs.

Also, check the soldering on T1 & T3.

Did you set the bias yet? You may get little or no output without bias.

Best of luck, keep us posted ;-)

Regards,
Jon

Sorry Maplins don't sell them, we have to import them from the USA.

Please double check there isn't a short on the PCB then send me your address

by personal email - I will post you a couple tomorrow. I haven't had any

fail but have had shorts on the PCB.

Yes, the R32/T3 junction is also +6v and Q9 is correct orientation.

I'll change Q9 and see where that takes me.

Thanks

OK Darren,

If the base volts reads +6 and the emitter reads +2 with no mod, then either

Q9 is suspect e-b o/c, or in backwards? I assume the volts reading on R32 /

T3 junction is +6 also?

Hi David

Didn't know you had an MKARS80.

An amplifier wouldn't be much use. I need to get rid of this neighbour who complaind to the council every time I move
and get a working antenna up.
Unfortunately, I'm limited to a maximum of 30 feet for a tower and 38ft total antenna height.
That's not really enough for HF.

Hi to all on the list
I completed the construction this morning, all worked first time.
Now on to the second one for my friend. I had a couple of ceramics missing, but otherwise all fine.
I am using an old cb mike, does this mean I should leave r17 in?
I have left my r2 fully anticlockwise for now until I have a heatsink on q1.
Next I will probably add cw as an option.

Hello Nigel,

Sorry to hear we left some ceramics out - must have been one I packed!
Please let me know if you would like them replaced....

If using a dynamic microphone it is best to leave the resistor out or
alternatively fit a cpacitor in series - a 1uF should do the trick, positive
end to the rig.

1445. Display colors black

Yahoo group: mkars80
Date: 2009-12-27 10:04:35 UTC
From: Ernest Neijenhuis
Topic: 1443 Message: 1445

Goodmorning,

It bought this kit in june 2008 to see if this is something to introduce as a project for the local radio club. I was seriously impressed by the quality of the kit, especially the documentation!

During the fieldday in 2008 my wife started assembling it. But back home again we had so many other things to do, so it soon ended up on one of the shelfs here in our shack. There it stayed for over a year, collecting dust and so...

But finally... this week we found some time again to work on it. Yesterday we finished assembling the PCB, This morning I plugged in the speaker, antenna and power and we immediately received lots of stations. So the receiver seems to be FB!

Then we inserted the PIC and put the display on the rear site of the PCB. Unfortunately that display doesn't give any reading, all cells turn black when powered on, nothing else happens. I verified some DC voltages, this seems to be ok. Any suggestions what could be wrong? Maybe the PIC? Is there a way to determine wether the PIC is working or not?

73,
Ernest PA3HCM & Wytske PD2W

From: Steve Drury
Topic: 1443 Message: 1446

Hello Ernest,

If all 32 squares are black try adjusting R29 the display bias (contrast) control, I'm sure this will sort it.

Regards,
Steve G6ALU

From: Ernest Neijenhuis
Topic: 1443 Message: 1447

Ah... how simple a solution can be ;-)

I have a perfect reading now. Now I have to tune it into the band. I adjusted the trimmer on the big varicon, but I can't trim it down to the CW part of the band. But I will continue with the manual now on how to adjust the TRX.

Thanks for the quick reply!

73,
Ernest PA3HCM

1448. OOoops, not working

Yahoo group: mkars80
Date: 2009-12-31 18:22:24 UTC
From: Luis
Topic: 1448 Message: 1448

Hi to all:
The first excuse my bad English, not so long ago that I practice.
I finished setting up my MKARS80 and Oops does not work
First visual inspection --- OK
Tensions in R34 (5v) and VR2 (8v) --- OK
Short circuit --- OK
Connect PIC and LCD --- ops
The display shows the first line fully illuminated, the second only partially.
Adjust the display contrast (R29) and the situation does not improve
No welcome message and shows the supply voltage.
Position is checked every component --- apparently OK
PIC firmware is checked --- OK
TP is checked Mhz 10Mhz --- 0 --- Bad
TP is checked Mhz VFO --- 0 --- ?????

Is all this wrong? What's going on? ¿Mounting problem?
Suggestions to solve this

Happy new year Luis!

Bad news that your radio doesn't work - the first thing you must do is check ALL the transistor voltages (in receive) and compare against the chart in the manual.

Note that the micro gets its clock from the BFO oscillator, this means you will not get a display until the VFO works.

Come back here if you don't have any luck.

Regards,
Steve G6ALU

1453. Building my mkars80

Yahoo group: mkars80
Date: 2010-01-02 21:22:27 UTC
From: zip
Topic: 1453 Message: 1453

Hi all,

Having spent some 12 hours over Christmas building my mkars80, when I applied power to it I was very disappointed only to find that it worked first time.

All I have to do now is to find a piece of wet string that I can run down the length of the garden to connect it to.

Being serious, excellent kit with high quality components and unambiguous instructions, it gets my recommendations. All I've got to do is sort out a ½ wave length antenna then I will be able to make full use of it.

73s,

Phil

I started my MKARS80 over the Christmas too, but have only fitted bags 1, 2 and 3. Now I'm tied up completing last years expenses for work and printing / mounting for my photography clubs competition next week, I've run out of free time. At least I've started, I've had the kit since the last MKARS rally.

I can only echo Phil's comments, a first class kit and foolproof instructions.

Dave,

It's fully cased, but I drilled the case several days prior to working on the PCB. The case probably took another hour, but getting the drilling template to size took over 2 hours.

I was lucky that after I printed out the template I checked it for size, if I hadn't and drilled the case the case would have been useless as the hols would have all been in the wrong place.

If I remember I will bring it with me next Saturday.

Steve,

If I may offer two tips, first if you print out the drilling template, check it has been printed true to size before drilling.
The second is if possible use a Weller soldering iron with a No.8 tip when you soldering the polyurethane coated copper wire i.e. the coils and you don't need remove the coating before soldering. If that's not possible suggest you use wire wool to remove the polyurethane prior to tinning / soldering.

Subject: RE: [mkars80] Building my mkars80

Dave,

It's fully cased, but I drilled the case several days prior to working on

the PCB. The case probably took another hour, but getting the drilling

template to size took over 2 hours.

I was lucky that after I printed out the template I checked it for size, if

I hadn't and drilled the case the case would have been useless as the hols

would have all been in the wrong place.

If I remember I will bring it with me next Saturday.

Phil

i beat you to it Phil, i told steve you did it in 12 hours flat. i think

the success is due to that soldering iron nr 8 which gives out more heat.

you didnt tell me yesterday if you had put it in a case yet, if so you can

bring it in to BP and let us have a look at it. david G3ZPA

Subject: [mkars80] Building my mkars80

Hi all,

Having spent some 12 hours over Christmas building my mkars80, when I

applied power to it I was very disappointed only to find that it worked

first time.

All I have to do now is to find a piece of wet string that I can run down

the length of the garden to connect it to.

Being serious, excellent kit with high quality components and unambiguous

instructions, it gets my recommendations. All I've got to do is sort out a ?

wave length antenna then I will be able to make full use of it.

73s,

Phil

Hi Phil,

I've stated a number of times (on here) the importance of using a hot iron to remove the polyurethane coating from the enameled covered wire - I suspect there are few here with a Weller TCP iron - including me, I use a 25W Antex and find it works well. I've not tried wire wool, does it work OK on the very thin wire?

Steve,

If I may offer two tips, first if you print out the drilling template, check it has been printed true to size before drilling.
The second is if possible use a Weller soldering iron with a No.8 tip when you soldering the polyurethane coated copper wire i.e. the coils and you don't need remove the coating before soldering. If that's not possible suggest you use wire wool to remove the polyurethane prior to tinning / soldering.

I started my MKARS80 over the Christmas too, but have only fitted bags 1, 2 and 3. Now I'm tied up completing last years expenses for work and printing / mounting for my photography clubs competition next week, I've run out of free time. At least I've started, I've had the kit since the last MKARS rally.

I can only echo Phil's comments, a first class kit and foolproof instructions.

From: panzerbeeb
Topic: 1453 Message: 1462

Hi all,

When it comes to soldering the poly coated wire the type of iron doesn't matter that much as long as the bit has a reasonable flat area and is clean.
I place my iron on a stand with the bit facing upwards, feed a bit of solder onto it, and dip the CUT END of the copper wire into the solder, and feed in solder until the poly coating burns back allowing the copper to tin. The vital point is that applying the iron to any bare copper area allows the heat to transfer quickly, the poly coating otherwise allows the wire to float in a thermally insulating pool of flux and poly gunk.
Tin all the wire ends before fitting any coils to the board, and soldering should be easy and reliable.

Happy New Year, and happy tinning.

Mike G8EEY.

Hi Phil,

I do use a Weller TCP iron, I've a selection of different bits
covering 700, 800 and 900 deg. F. Mikes suggestion is a little like
using a mini version of the old solder pots you never see now.

Thanks for the tip re the drilling template, I'll double check it
before making any holes.

See you at the start of the course on the 13th.

1464. RE: [mkars80] Building my mkars80

Yahoo group: mkars80
Date: 2010-01-03 22:18:33 UTC
From: Phil
Topic: 1453 Message: 1464

Steve,

In the dim and distant past I work for a company that made coils for the GPO/BT and the girls used to solder the coils using a No.9 bit. But they were like lightening when they soldered them, when I tried a No.9 the solder vaporised.

I have used wire wool in the past on thin copper before I got a No.8 tip, how thin I really can't remember, but it must have been 28SWG or thinner. If my memory is correct I grabbed the copper wire in the wire wool and then pulled the copper wire through the wool, then tined the ends before soldering the coils in place. The thinner the wire the more genital you have to be with the pressure when squeezing.

1465. The aerial of a range of 80 metres for a campaign.

Yahoo group: mkars80
Date: 2010-01-04 18:02:26 UTC
From: Konstantin
Topic: 1465 Message: 1465

Greetings to all!
Many of us face necessity to place the aerial 80ì in the limited territory.
I have solved for a long time already this problem. I use the aerial lifted on a fishing telescopic fishing-rod long 7ì. The aerial works better than a dipole of 12 metres lifted on height.

Phil,

The 40M version wasn't very successful based on the MKARS80 PCB -
electrically it worked OK but had a loud pop through the speaker on TX to RX
and RX to TX transitions.

For the time being it has been shelved.

From: Phil
Topic: 1453 Message: 1475

Steve,

That's a shame, but as I was looking to us it for TX only on 40m, do you have a list of the mods needed?

Phil

Subject: Re: [mkars80] Re: Building my mkars80

Phil,

The 40M version wasn't very successful based on the MKARS80 PCB - electrically it worked OK but had a loud pop through the speaker on TX to RX

and RX to TX transitions.

For the time being it has been shelved.

1478. Re: Building my mkars80

Yahoo group: mkars80
Date: 2010-01-13 23:32:10 UTC
From: vk2jdp
Topic: 1453 Message: 1478

I'm keen to get something working on 40m. I was going to build my first one as 40m but decided to try one 'proper' first. In Oz, we are always battling lightning crashes on 80, and 40 works better for daytime too.

I have decided to just buy another kit, and try a few things. The 2 things I need to know are, what about 13.5MHz as a better IF? Farnell has these crystals quite cheap. Secondly, what am I going to do about the program to get it to work?

I assume that all of the timing for frequency display would change. The VFO can stay as-is. The huff 'n' puff lock points would open up a bit but no problem. The real problem is that I have no programmer or experience in these things unfortunately.

That's what you get for being a boat-anchorist Hi Hi ;-)

Maybe I could ask Steve on a bended knee to modify a program for me - obviously at a more suitable time? It will take a little time to build the unit and get the hardware ready anyway ;-)

Regards,

Jon

Date: 2010-01-14 06:53:33 UTC
From: Steve Drury
Topic: 1453 Message: 1479

I already have an ammended program so no problem there - the one I have is for 12MHz crystals.

Subject: [mkars80] Re: Building my mkars80

I'm keen to get something working on 40m. I was going to build my first one as 40m but decided to try one 'proper' first. In Oz, we are always battling lightning crashes on 80, and 40 works better for daytime too.

I have decided to just buy another kit, and try a few things. The 2 things I need to know are, what about 13.5MHz as a better IF? Farnell has these crystals quite cheap. Secondly, what am I going to do about the program to get it to work?

I assume that all of the timing for frequency display would change. The VFO can stay as-is. The huff 'n' puff lock points would open up a bit but no problem. The real problem is that I have no programmer or experience in these things unfortunately.

That's what you get for being a boat-anchorist Hi Hi ;-)

Maybe I could ask Steve on a bended knee to modify a program for me - obviously at a more suitable time? It will take a little time to build the unit and get the hardware ready anyway ;-)

Regards,

Jon

1480. Re: Building my mkars80

Yahoo group: mkars80
Date: 2010-01-15 06:03:49 UTC
From: vk2jdp
Topic: 1453 Message: 1480

Steve,

OK then, is is possible to order the kit with the xtals and program, or at least the program? It would be nice to get at least the same brand/style of xtals so I don't have to re-align the filter. I would be happy to try and 'stop the pop' with the speaker ;-)

Might just tack a J174 FET across the LM386 input and drive it from the TX+, with an RC network for a start?

I have been holding off ordering one until now. If the program will work and I can get it, I'm sold ;-) If you want to just do a standard kit but with the IC and xtals as extras, I'll do that instead. Saves ripping a kit apart. Please let me know.

Regards,
Jon

I'm pleased to see the built MKARS80 and power meter sold for nearly ?70.

There can't be many kits that appreciate in value once built!

Its likely the pop could be solved with a fet in place of the mute transistor and with the addition of a "bleed" resistor to get rid of any DC component - I will investigate and get back to you in a few days. If successful I will be looking for a Guinea pig!

Subject: Re: [mkars80] MKARS80 on Ebay

I'm pleased to see the built MKARS80 and power meter sold for nearly ?70.

There can't be many kits that appreciate in value once built!

1484. VFO looses lock after releasing ptt

Yahoo group: mkars80
Date: 2010-01-17 23:04:28 UTC
From: isutty
Topic: 1484 Message: 1484

HI Team,
I have had my MKARS80 going for a couple of months. Its GREAT!
BUT it has developed an annoying fault though..
When I release the PTT it looses lock. I get the U for the 3 seconds while it settles down. This happens even after 2 hours warm up. It was fine when I first built it. I have re checked the TX bias. Any thoughts would be appreciated please.

Hi Ian, I am new to this group, This type of fault is always tricky, the VFO is not switched between TX and RX, however the VFO is getting disturbed, by what you say. You are going to have to check for poor soldered joints, try warming up the board, and see if you can locate a sensitive area. Have you tried to re-align maybe the VCO is just on the edge of its control range. I am not sure the TX bias would stop the lock, as the VCO would not even know if the PA strip was missing!! Measure the voltage on the centre of the fine tune pot, and scope it, see if it jumps between TX/RX let me know your out come. Do you have access to RF test equipment?

Check also the output of the 8V regulator witha meter, make sure it doesn't jump between TX and RX - just a thought, your power supply is > 10V and its not jumping when you release the PTT is it?

The VFO buffer is effective and I've not had this problem on a production kit - I did have it on the prototype before I supplied the VFO and buffer from the 8V regulator.

If all else fails you know where to send it!

1487. simple build-in cw adaptor

Yahoo group: mkars80
Date: 2010-01-19 08:43:54 UTC
From: martienrijssemus
Topic: 1487 Message: 1487

Hello,

Although the available cw adadtor is a very good choice I wanted something simple build into the original housing for portable use.
For those of you who are interested I added a file in the files section (simple cw adaptor.pdf).

Just a thougth: maybe D6 is defective or has a bad solder joint. If D6 is defective the coil of the relais will give a spike on the powersupply voltage when the PTT switch is released.

From: vk2jdp
Topic: 1453 Message: 1489

Steve,

If you have some luck (or not), I'll be a guinea pig (can't be any worse than a teenager's cooking...)!

I suggest the J174 for a start, but if the 'on' resistance is too high, maybe you can suggest a better alternative.

Either way, let me know and I'll go ahead and order a kit.

Regards,
Jon

From: isutty
Topic: 1484 Message: 1490

Steve,
I have fixed my problem with the VFO lock. The regulator was OK. I re-touched all the solder points around the vfo.... didn't fix it. I then re-tuned the balanced mixer. YEAH! problem solved. Now as solid as a rock.
Thanks to all who offered advice.
Best 73 Ian

1491. Building my mkars80

Yahoo group: mkars80
Date: 2010-01-19 21:46:24 UTC
From: zip
Topic: 1453 Message: 1491

Hi Steve,

Over the last couple of days I've been using my 80 in digi mode and while I was play this afternoon I have a receiver alongside and I noticed that while I was transmitting the audio from the receiver was drifting, not by much, but I could hear it. To cut the story short I can confirm that this drift was due to temperature build-up inside the case. So I think my first mod will probably be the fitting of a miniature 12v fan inside the case and make some vents for the air flow.

Phil

Ian,

I'm glad you fixed it, I guess lack of balance here could cause the problem.
I will have to unbalance mine and try it!

Phil,
Are you using version 2.4 firmware - its displayed on the start-up screen.

Was this a slow drift and did the tuning bars move?

From: Phil
Topic: 1453 Message: 1494

Steve,

I can confirm its v2.4.

The drift was happening during digi mode transmission and I was listening to my transmission on a separate receiver. The drift was very slow but it was continues and an indication that it could be temperature related.

I believe it to be heat build-up inside the case during transmission because I was on the air last night for an hour in digi mode with the base of the case removed (not ideal) but just to test to see if airflow would stop the drift. During that time I was again listening to my transmission and I didn't hear any drift.

Phil,

When using digital modes such as PSK31 the output FET is turned on for much more longer periods than with SSB speech. This is likely to be warming things up more than with normal use.

Yes there is something wrong around Q18 - is there a blob of solder between colector and base, check the top side of PCB.

If you have an oscilloscope check for a waveform on the emitters of Q11 and Q12.

Hi to all:
EXCELLENT SOLUTION Steve.
Really there was a short circuit between collector and base of Q18, for the side of the welding... a beginner's error...
The oscilloscope shows signs sinoidales in emitters of Q11 and Q12 (1 to 2.4 v p/p +-6Mhz). The frequency does not appear in the display

To the beginning it shows message
MKARS80 v2.4
www.mkars.org.uk

later
LSB 0.000.000 Hz
Bat 12.7V U

The number of the Mhz shows a strange symbol (similar to Unicode U+018F) and the rest quite to zero

Luis,
As you have a waveform at Q12 emitter you should have one at TP VFO, please check.

What voltages have you got on Q8? If OK check pin 12 of IC2 with your oscilloscope, there should be a large waveform there.

Rob,

With R2 fully anti-clockwise 270mA is typical, with no modulation adjust it for a 50mA increase IE 320MA. I suspect your supply is quite high?

1508. RE: [mkars80] R2 PA bias current

Yahoo group: mkars80
Date: 2010-01-30 21:20:54 UTC
From: Phil
Topic: 1503 Message: 1508

I wound it up to full power tonight on digi mode without any noticeable freq drift. The fan is 12v but only 1 1/2" dia but I think its doing the business.

I did manage to contact John Pether tonight using my 80 + fan via digi mode, but too much QRM so the exchange was a bit sporadic.

Is anyone else in the group using an 80 in digi mode???????

Phil

1509. Low output power

Yahoo group: mkars80
Date: 2010-01-30 23:45:29 UTC
From: Jerome
Topic: 1509 Message: 1509

Hello all, Just finished my mkars80 and everything works great. The only question I have is how to increase the output power. I can only get 3.5 watts out and from what I read on this site everyone else is getting 6 watts out. Is there anything I should look for to increase the power ? Thanks Jerry

1510. So close but so far! Please help me get my MKARS80 on air

Yahoo group: mkars80
Date: 2010-01-31 09:13:59 UTC
From: Carl
Topic: 1510 Message: 1510

Good morning group!

(from Carl, DA6TEC // da6tec@...)

Thank you to Steve for help over the last few days, now 90% complete in building the MKARS80. I thought it better to ask these questions and request help from you kind people on the yahoo group!

I am making some progress with my MKARS80 although I am now having a few pronlems aligining it for tx and on closer inspection have found some transistor voltage measurements to be different to that expected from voltage tables in the manual.

In outline:
- Kit built, rcvr working very well (listening to west coast US on dx part of band last night).
- LCD working fine and aligned.
- tuning range set up
- All component placement checked and checked for solder blobs and dry joints (althouh I am not an expert!)

Some figures:
- current drawn on rx is 110mA at 13.8V DC
- current drawn on tx was 240mA at 13.8v and noww adjusted to 285mA using R2 and the bias procedure in the manual
- R59 and C103 adjusted whilst tx into 100W dummy load but seems to have little effect on power output

Problem:

When I PTT 'on' I output a high pitched tone at 1.5 - 1.8W. There is not audio being picked up by the elecret microphone insert i am using (tapping it, speaking into it etc show now difference in output power or audio received on an adjacent monitor tcvr)

Of the measurements in the table below the most significant differences comapred to the table in the manual are all on tx (figures in brackets are figures in manual, my measurements not in brackets):

(I should add that I do not have a full RF lab here in the broom cupboard!) I have a multimeter, RF probe, dummy load and a commercial tcvr for reference (FT817) and a big mug of tea :)

All on TX:
Q9
E=3.7V (2.4V)
B=2.1V (3.2V)

Q10
C=6.8V (3.8V)

Q20
E=3.6V (2.9V)
B=2.9V (3.7V)

1511. mixer balance

Yahoo group: mkars80
Date: 2010-01-31 10:21:14 UTC
From: robpegsuk
Topic: 1511 Message: 1511

Just a quick question before i fit the radio into the case.
I only have access to a DVM, I have adjusted R59 and reduced to Zero, my question is, this has been done without any adjustment on C103. should i bring R59 up a little and then adjust C103 to bring back down to Zero,thus trimming using both R59 and C103.

Or just leave it at Zero just using R59.

Rob

Rob,

You need to follow the instructions in the manual as closely as you can - adjust R59 and C103 for minimum carrier out WITHOUT any modulation, note they interact so you will have to adjust C103 a little then re-adjust R59. If you haven't got another receiver or oscilloscope it is possible to monitor the level of RF with a 1N4148 diode simply "poked" into the RF socket and monitored with your DVM. When you have reached the point of mixer balance the voltage measured will be low.

When making this adjustment put the MKARS80 into transmit by inserting a microphone plug with all pins shorted, also make sure you adjust the PA bias FIRST!

Steve G6ALU

Sorry forgot to add I do have a Receiver to monitor, I guess 103 was not far off to start with then, as a slight tweak on R59 dropped the level to near on zero.

Hi Carl

Just looking at your voltages I would suggest you have a short circuit, such as solder or similar, between the Emitter and Base of Q21.

I would also suggest verifying the orientation and component type of Q9, Q10 and Q20. Are Q9 and Q20 both MPSH10? Are they correctly inserted? They should match the screen print on the board. Also remember when measuring the MPSH10 transistor voltages that they have a different pin out to the BC547. See page 19 of the V1.3 manual for details.

I hope this helps.

Regards

Peter VK3ZPF

You normall have to adjust C103 about 1/2 a turn but if you can't hear the carrier dont worry - check the SWR meter is registering zero power.

Steve

From: Steve Drury
Topic: 1510 Message: 1516

Carl,

This could be the result of poor mixer balance - see my email to Peter to see methods of adjustment; do not adjust with a microphone connected. If you can't get balance (that is zero output power) check the transformer T5 is soldered properly.

Looking at your voltage readings I suspect you have got confused with the transistor pinouts. There are 3 differing types of pinout used with the ZTX615, BC series and MPSH10.

Steve

1517. Re: So close but so far! Please help me get my MKARS80 on air

Yahoo group: mkars80
Date: 2010-01-31 16:44:11 UTC
From: Carl
Topic: 1510 Message: 1517

Steve, Peter, all

Hi thanks for your help. I am still battling away at trying to get the radio on the air. I have looked through all the messages on the group and followed the advice (not sure specifically which email to Peter you were refering to but I think I have read everything!).

I note you suggested in one post shorting out Q3 Base and Emmiter whilst pressing the PTT with mic connected. As warned I did get massive feedback - white noise, loud hum and what sounded like faint music front a broadcast station.

I have checked and doubled checked the transistors. As you suspected, I had taken a couple of measurements off the wrong pins! Now that is sorted out the only reading that worries me is the Collector on Q10 which is measured at 6.8V rather than the 3.8V listed in the manual. (I just checked the 510 again and its' pins are at the correct voltages on rx and tx).

I had followed the setting-up of the PA bias as it states in the manual. It was drawing 260mA on tx (110mA in rx) with R2 fully ACW and no mic connnected. I increase it to 305mA by adjusting R2 slightly CW.

Setting up the mixer has been problematic. On PTT my wattmeter needle swings to the right in the 1W vicinity before returning to the zero mark in a fraction of a second. No carrier is detected on a nearby receiver. With an electret microphone insert connected there is no audio being picked up by the mic. Setting up the mixer is difficult because other than the initial spike when flicking the PTT to tx there is no carrier against which to adjust power.

I have resoldered T5 to try and iron out a fault there.

The red led modulator light remains fully lit. Even when an electret mic is connected (tried 3 inserts now) the red LED does not extinguish or flicker.

I am now well and truly stumped! ideas?

Thanks in advance for any help anyone can offer,

Carl
DA6TEC

Hi Rob

http://www.radio-kits.co.uk/mkars80page.html is where you will find the drilling template. (second item in the download list)

Take care to align the top and side carefully as I made a real mess of mine by not getting that right. See http://vk3zpf.blogspot.com/2009/12/mkars80-update-5.html

First don't worry about the high voltage on Q10 collector, this will depend on RF output.

305mA is a typical TX current with no audio so OK there.

When first pushing the PTT you will normally see a quick "kick" of the power meter, this is probably a good sign as it shows most of the stages are "alive".

Shorting B-E of Q3 shows the microphone amplifier is good so OK there.

If you connect a piece of wire to the antenna input of your receiver and drape the wire near (BUT NOT TOUCHING any part of the MKARS80) can you hear any modulation? Rock the tuning backwards and forwards just in case its not on tune.

Hi Rob,

After you print out the template just check that it has been printed true to size. My first attempt was slightly smaller than it should have been, luckily I checked it first otherwise all the holes would have been in the wrong place.

Phil

Hey

I have run a length of equipment wire from the centre pin of the FT817 SO259. When I PTT from the MKARS80 there is a loud click on the tcvr FT817 (set to same freq at MKARS80), but after this short click there is no carrier, or modulation, I have tried 2 different electret modules (both recovered from working PC Type headsets). No power on the wattmeter either.

Staring at it whilst drinking a cup of tea at the moment. Not sure Jedi magic is going to work but I dont know what else to do now !!! hi hi

1525. Re: [mkars80] Re: So close but so far! Please help me get my MKARS80 on air

Yahoo group: mkars80
Date: 2010-01-31 22:20:28 UTC
From: Steve Drury
Topic: 1510 Message: 1525

I will have a think Carl, nothing comes to mind at the moment... the click (and transient power indication) indicates to me that there is an RF path from the mixer to output and you know the microphone and amp is OK because you get audio feedback if you disable the mute transistor.

Any ideas anyone?

Steve G6ALU

From: Steve Drury
Topic: 1509 Message: 1526

If you have a 'scope check to see if the waveform on the drain of the output transistor approaches ground - probably a volt or two?... does the LED flicker off? If yes to these questions then check the components in the LPF, number of turns on the coils etc.

Steve, I do not have a scope but I checke the coils and ever thing
looks good there. Yes, the LED does flicker and I get vary good reports on the air.

From: martienrijssemus
Topic: 1509 Message: 1528

Hello Jerry,

Just to make sure: what is your supply voltage when transmitting? My unit gives exactly 5 Watts (measured with a 1GHz scope at a 50 Ohm dummyload) but this ofcourse reduces when the supply voltage drops below 13,8V.

Hello Martien,
My voltage is 13.1v and I'm using a 12 amp power supply. Do you think I should run it at a high voltage ?

From: mark
Topic: 1530 Message: 1530

Hi Steve as the photos show the mk2 is coming along very well. Have you got a pic that will lock the huff and puff on 3.7750 MHz .
If you have one programmed I could do with one. I cant program the pic chips here (would not now where to start) so if you now of one can you let me now the cost or where I could get hold of one all the best from Mark 2w0jmk

Hello Jerry,

Why dont you give it a try, cranck up the voltage to 14V and see if you can get it up to 5 Watts? Another possible cause: some powersupplies create problems when there are RF fields nearby. Did you check the voltage and the curent when transmitting (loud whistle in your microphone)? Last question, and again just to be sure, how accurate can you test the output power at these relatively low levels?

73,

Martien PA4H

The "standard" voltage is 13.8V.

I did try with another power supply at 13.8v and the results was the same. I also used two different meter with low power settings and the read adout the same. One of the meters is digital and one is anolog.

Jerome,

Do you have to speak loudly to get the 3W - normal speech around 6" from the microphone is normally sufficient. If you whistle VERY loudly you can't get above 3W? Does the LED stay off whilst whistling? What current does it draw whilst whistling?

I'm trying to determine where the problem is.

Hi Mark,

This bug is still on my to-do list - I will bring it to the top and let you know when its sorted.

Hi Steve thanks for the reply I have to admit it's doing my head in hi hi.
I acquired a 10k 10 turn pot tonight in my local club and I must say it makes hell of a difference in tuning the radio.
Thanks for your time Steve all the best from mark 2w0jmk

1538. Re: Low output power

Yahoo group: mkars80
Date: 2010-02-01 22:23:25 UTC
From: Jerome
Topic: 1509 Message: 1538

Steve,

It draws 1.18 amps on a loud whistle and the LED does go out.
I can get 4 watts out on a vary loud whistle and when I speak into the mic at 6" I have to speak vary loud to get 3.5 watts out. I have tried 3 different mics and the one I use seems to work the best. I get vary good audio reports with it. Jerry

1540. Fan assisted mkarsS80

Yahoo group: mkars80
Date: 2010-02-01 23:27:58 UTC
From: zip
Topic: 1540 Message: 1540

Steve,

Just to give you an update, since I've modified my mkars80 to a turbo assisted model (added a fan inside the std case), its frequency is now completely stable. I set the frequency up at power up and 30 minutes later on digi mode (full duty cycle) the frequency has not changed and also there is no frequency drift while listening to my own transmissions.

There is another positive side affect of the fan and that is, as there is no audio because it's fed into an isolation transformer for the PC, one can hear a pleasant purr from the fan to let me know that it's powered up.

This is my second venture into the world of RF and since I've been on air using the mkars80 which has been about two or three weeks for a couple of hours in the evening using it in digi mode with my very inefficient 15m long wire, my mkars80 has done the business. I've had contacts in Luxemburg, Netherlands, Belgium and of course the obligatory Germany. When the weather permits I will be increasing my long wire to ½ wave, who knows how far your transceiver design will get me.

I would love to be able to show you my first venture into RF which was about 30 years ago, but alas to say Dave (G3ZPA) hasn't any photos. But I will say it was slightly more powerful that a few watts and I am here to be able to say, I was not inside when it was powered up.

I would just like to congratulate you on your superb design for a low cost 80M transceiver, in my opinion it's worth every penny of the 50 quid.

If anyone ventures into BPSK-31 on 80M using an mkars80 of course, give me a call, I'm normally on between 17.00 ☐ 18.00 & 20.00 ☐ 21.00.

1541. Build complete....

Yahoo group: mkars80
Date: 2010-02-02 01:48:46 UTC
From: a_strong@btopenworld.com
Topic: 1541 Message: 1541

I finished assembling my MKARS80 kit yesterday, 8 days to the day after placing the order with Steve. Total build time about 30 hours, which included metering every component before fitting. The coils were very time consuming, partially due geriatric fingers and eyes but also an ill-timed telephone call from an ex-friend. The set worked first time and the setting up was a piece of cake, but I do have a decent scope and frequency meter.

Just two observations, the receiver audio output is quite low on the two speakers that I tried, both 8 ohms but adequate on headphones. I wonder if this is normal or just a problem with my build? Would replacing the LM386-1 with an LM386-4 help?

2. - I placed three resistors wrongly by confusing their respective tick-boxes. Personally I would prefer either, the tick box to the left of the the descriptive text, or the descriptive text to be right justified so that it is close to the tick-box. However these mistakes were discovered very quickly, well before switch on time.

Many thanks to Steve for designing and marketing an affordable little set that is truly portable.

Tomorrow is metal bashing day!

Alan G3WXI

Steve,

Re: 40m version

Have you had time to look at the mute issue yet? If not, I'd be happy to order a kit (with the different xtals & program) and give it a try myself.

BTW I have muted LM386s before by just injecting DC into pin 2 (the inverting input). It still gives a bit of a 'plop' but this can be controlled with an RC network i.e. resistor from TX+ to cap, resistor from pin 2 to junction of first resistor and cap. Other side of cap to gnd. I used this method on a previous QRP TXCVR.

The credit card is poised...

PS I'll probably take my MKARS80 to the Wyong Field Day to see what interest I can generate. This is the biggest hamfest event around here.

From: Steve Drury
Topic: 1540 Message: 1543

Thanks for the compliments Phil, sounds as though the little fan is doing the job then. The radio wasn't really designed for digi modes but as its "straight through" with little audio shaping I expect you get good results. I have left mine on receive for hours getting pictures off DRM on 3.733MHz.

I can guess what you original PA was.. I bet it wasn't homebrew!

Subject: [mkars80] Fan assisted mkarsS80

Steve,

Just to give you an update, since I've modified my mkars80 to a turbo assisted model (added a fan inside the std case), its frequency is now completely stable. I set the frequency up at power up and 30 minutes later on digi mode (full duty cycle) the frequency has not changed and also there is no frequency drift while listening to my own transmissions.

There is another positive side affect of the fan and that is, as there is no audio because it's fed into an isolation transformer for the PC, one can hear a pleasant purr from the fan to let me know that it's powered up.

This is my second venture into the world of RF and since I've been on air using the mkars80 which has been about two or three weeks for a couple of hours in the evening using it in digi mode with my very inefficient 15m long wire, my mkars80 has done the business. I've had contacts in Luxemburg, Netherlands, Belgium and of course the obligatory Germany. When the weather permits I will be increasing my long wire to ? wave, who knows how far your transceiver design will get me.

I would love to be able to show you my first venture into RF which was about 30 years ago, but alas to say Dave (G3ZPA) hasn't any photos. But I will say it was slightly more powerful that a few watts and I am here to be able to say, I was not inside when it was powered up.

I would just like to congratulate you on your superb design for a low cost 80M transceiver, in my opinion it's worth every penny of the 50 quid.

If anyone ventures into BPSK-31 on 80M using an mkars80 of course, give me a call, I'm normally on between 17.00 - 18.00 & 20.00 - 21.00.

Hello Alan,

The audio output is normally cosidered to be very adequate - if you couldn't get any TX power I would expect a problem with one of the mixer transformers but as its working OK these are ruled out. It may be worth just checking the DC voltages on the transistors in the receive line just in case there is a problem there, its quite common to get solder bridges between C-E or B-E leads - the receiver still works but will be quiet.

On a reasonable antenna (G5RV, dipole etc) you will need to turn the RF gain back in the evening.

Jerry,

Mine draws the same peak current. Of course the 5 Watts is only in the peaks, so with a loud whistle. Average power when QSO-ing is much lower.Did you measure the power with a dummy load or did you use the antenna?

Hi Phil,

When the weather permits I will be increasing
my long wire to ½ wave, who knows how far your transceiver design will get me.

You be amazed! I am using a low hanging dipole (2 times 14 meter so actually too short) with open feeder and of course a tuner. Most stations I can hear on my MKARS80 I can also work, sometimes with amazing signal strength. Best DX so far: 1300km.

From: a_strong@btopenworld.com
Topic: 1547 Message: 1547

The LCD voltage display on my MKARS 80 consistently reads about 0.3 volts low. With an applied voltage of 13.8V (three different DVMs agree) the indicated voltage 13.5V. Can anyone tell me if this tolerance normal?

I have not found any similar questions about this in previous questions but that may be due to me not hitting on the right search keyword.

Hi Steve - many thanks, My aerial is not of the best, only a low level inverted "V" doublet resonant on about 20MHz. I will investigate. Very nice received audio quality however but still low even on a computer type headset.

The Mainline slomo drives arrived this morning so I am looking into how to fit those at the moment.

Martien, I tested it on the antenna and on a dummy load and the output was the same. The antenns SWR is flat.

Jon,
I investigated it again the other evening - problem originates from the colapsing RX 12V supply, it isn't muted properly as it is muted via the TX supply which is rising at the same time! I think it needs some simple logic from the PTT to clamp the audio before the relay throws.

I also tried a 2N7000 as mute but didn't work as well as a BC337.

Steve,

Re: 40m version

Have you had time to look at the mute issue yet? If not, I'd be happy to order a kit (with the different xtals & program) and give it a try myself.

BTW I have muted LM386s before by just injecting DC into pin 2 (the inverting input). It still gives a bit of a 'plop' but this can be controlled with an RC network i.e. resistor from TX+ to cap, resistor from pin 2 to junction of first resistor and cap. Other side of cap to gnd. I used this method on a previous QRP TXCVR.

The credit card is poised...

PS I'll probably take my MKARS80 to the Wyong Field Day to see what interest I can generate. This is the biggest hamfest event around here.

1554. Re: [mkars80] Voltage indication is low...

Yahoo group: mkars80
Date: 2010-02-02 22:35:08 UTC
From: Steve Drury
Topic: 1547 Message: 1554

The voltage reference for the battery voltage indicator is taken from the 5V supply, the 78L05 isn't specified for accuracy (5%), so a small change in the 5V regulator output will result in a similar inaccuracy in the volt meter reading.

Your option are; trim the values used in the code (not hard) or make a small adjustment to one of the potential divider pair R21 / R23. This pair of resistors divide the input voltage to a range that the A/D converter can handle - as your error is less than 2.2% only a small change is needed, I wouldn't worry about it.... when it reads 10V thats the time to worry!

Steve

Jerome,

You appear to have to speak louder than normal to achieve the 3.5W output - have you checked all the small transformers to check the wires are soldered properly? You wouldn't notice a 6dB loss on receive but you would on TX.

From: martienrijssemus
Topic: 1509 Message: 1556

Hi Steve and Jerome,

Always good to double check those small transformers, but I would expect not only the output but also the DC current (when transmitting) to be lower when the gain in the Tx path is too low. Since the current is what is expected my best guess is (like Steve already suggested earlier) something to be wrong in the output low pass filter. Maybe a misplacement, or a broken capacitor, you could also check the soldering of the inductors and the relais.

Finally there could be something wrong in the filter L6,L7,L9. If something is wrong in this filter than there might be spurious/harmonics from the mixer into the amplifier (and the DC current would look normal) but the spurious will be attenuated by the output lowpass filter and your wanted signal power might be low.

From: Ray Stringfellow
Topic: 1509 Message: 1557

Hi All
The accuracy of even good quality commercial amateur power meters at
low levels is poor. (+_ 20% is not uncommon at the bottom of the range)
It really would be better to test with a scope into a dummy load. It is
probable that there is no fault.
Ray

Hi Phil,

When the weather permits I will be increasing
my long wire to ? wave, who knows how far your transceiver design will get
me.

You be amazed! I am using a low hanging dipole (2 times 14 meter so actually
too short) with open feeder and of course a tuner. Most stations I can hear
on my MKARS80 I can also work, sometimes with amazing signal strength. Best
DX so far: 1300km.

From: vk2jdp
Topic: 1509 Message: 1559

Jerome,

What are you using to measure power with (silly question?) As Ray says, forget a 'wattmeter'.

For example:

Using my (pretty accurate on a carrier) 'peak hold' 'meter, I get about 2.5-3W when the light just goes out, on the 5W scale (with a 1kHz sinewave). On either CRO (yes, I'm a testgear junkie), I am seeing an envelope of about 44V peak-peak. 22Vpk is 15.6Vrms which, at 50 Ohms is 4.87W. This is with a 13.80V supply.

Any less than 2W on a 'meter with a whistle may indicate a problem. Any more than 3 probably indicates flat-topping. In a normal voice with no compressor, I usually see between 1-2W on voice peaks, with the LED just flickering. This all to do with the use of PEP measurements vs. meters that respond to averages.

So, I think that your radio is probably OK, as long as you can easily make the LED go out ;-)

Topic: 1547 Message: 1560

Hi all

I have seen a similar voiltage reading error

when I borrowed an earlier MKARS 80 from a local radio club member to compare sets I found that the volatge reading on his display was 0.2v higher than on mine - same battey pack etc

his was an early one with v2.1 fw (from memory) and mine is a newish one with v2.4. .....the firmware may be nothing to do with it

my "uncalibrated" DVM reads 0.2v higher than the display on mine

- great set, have the RX running OK now and plan to do the metalwork this weekend

Jerome,

What are you using to measure power with (silly question?) As Ray says, forget a 'wattmeter'.

For example:

Using my (pretty accurate on a carrier) 'peak hold' 'meter, I get about 2.5-3W when the light just goes out, on the 5W scale (with a 1kHz sinewave). On either CRO (yes, I'm a testgear junkie), I am seeing an envelope of about 44V peak-peak. 22Vpk is 15.6Vrms which, at 50 Ohms is 4.87W. This is with a 13.80V supply.

Any less than 2W on a 'meter with a whistle may indicate a problem. Any more than 3 probably indicates flat-topping. In a normal voice with no compressor, I usually see between 1-2W on voice peaks, with the LED just flickering. This all to do with the use of PEP measurements vs. meters that respond to averages.

So, I think that your radio is probably OK, as long as you can easily make the LED go out ;-)

One thing worth noting is that the power output is not constant over the full bandwidth, I found a considerable variation after the build. If you have access to suitable test gear, and enough patience, it is worth adjusting the 3 trimmers in the filter section for a level(ish) power output across the tuning range. These will interact and it is a juggling act to get the passband right, it took me around an hour to do the first time. You will need a single or 2 tone signal source into the mic socket, unless you can whistle accurately for half an hour or so on a single breath without going biologically QRT! It is also worth doing this at around 1W output level, unless you want to use your MKARS80 as a toaster :-)

From: Jerome
Topic: 1509 Message: 1563

After reading some of the comments I think some of you maybe right. Could one of you with a good digital watt meter give it a test and see how much your radio is putting out and let me know. If it's the same as I get then will call it case closed..

1564. Re: [mkars80] Re: Voltage indication is low...

Yahoo group: mkars80
Date: 2010-02-03 19:59:38 UTC
From: Steve Drury
Topic: 1547 Message: 1564

I've just measured my test units on a 13.8V supply, checked with a precision meter:

1st production part reads 13.9V
40 mtr prototype (has similar code) reads 14V, I measured the 5V regulator output which is 4.9V

The accuracy is dependent on the 5V regulator output; as I suggested before, if you want a more accurate reading trim the value of one of the divider resistors very slightly by placing another of higher value in parallel .

Hi Phil,

When the weather permits I will be increasing
my long wire to ½ wave, who knows how far your transceiver design will get me.

You be amazed! I am using a low hanging dipole (2 times 14 meter so actually too short) with open feeder and of course a tuner. Most stations I can hear on my MKARS80 I can also work, sometimes with amazing signal strength. Best DX so far: 1300km.

Hi Phil,

When the weather permits I will be increasing
my long wire to ? wave, who knows how far your transceiver design will get

me.

You be amazed! I am using a low hanging dipole (2 times 14 meter so actually too short) with open feeder and of course a tuner. Most stations I can hear on my MKARS80 I can also work, sometimes with amazing signal strength. Best DX so far: 1300km.

73

1567. Re: Voltage indication is low...

Yahoo group: mkars80
Date: 2010-02-05 14:06:32 UTC
From: g3oth
Topic: 1547 Message: 1567

Hi Steve and Co.,
For the record I have also made some measurements this morning on my bog standard MKARS80 constructed late 2008.
I am using a 7AHr Gel Cell Battery connected to the MKARS80 via 20 cm leads made up from 16/0.2mm wire.
On receive, the MKARS80 displayed 12.8 volts and my DVM at battery terminals displayed 12.83 volts.
IMHO results well within an acceptable tolerance.
A further observation for builders and something to watch out for.
Initially when using just a thin twin 2 meter cable with an integrated moulded plug, salvaged from a small wall wort, I found that there were quite large voltage drops across the cable (almost a volt under transmit conditions) which I considered to be unacceptable.
I would therefore recommend using as thick and as short power leads as possible, compatable with squeezing them into the power plug, before deciding on doing any circuit modifications.

From: a_strong@btopenworld.com
Topic: 1541 Message: 1568

Hi Steve and group members

With Steve's invaluable assistance the low audio problem has been cured, Q18 reversed. No excuses. I now have plenty of audio, even on my insignificant aerial.

The metal bashing did not go well in that I cut the display aperture sufficiently oversize to look untidy and I could not find a bezel to suit the display. I decided to use a back-lit display that I have which required the aperture to be made larger. A downside is that the back light draws as much current as the entire receiver so today's job is to fit an inconspicuous switch to turn it on only when required. Also, it dissipates a total of almost 1.5w which help to heat up the inside of the enclosure.

I also added a Mainline 6020/2 slow motion drive to the main tuning capacitor which is well worth the extra fiver and almost renders the fine tuning pot redundant.

All in all I am highly delighted with this little trannsceiver and add my voice to all those who sing its praises. Any problems that I encountered were of my own making.

Many thanks to Steve for his support in sorting them out for me.

Alan G3WXI

>
> I finished assembling my MKARS80 kit yesterday, 8 days to the day after placing the order with Steve. Total build time about 30 hours, which included metering every component before fitting. The coils were very time consuming, partially due geriatric fingers and eyes but also an ill-timed telephone call from an ex-friend. The set worked first time and the setting up was a piece of cake, but I do have a decent scope and frequency meter.
>
> Just two observations, the receiver audio output is quite low on the two speakers that I tried, both 8 ohms but adequate on headphones. I wonder if this is normal or just a problem with my build? Would replacing the LM386-1 with an LM386-4 help?
>
> 2. - I placed three resistors wrongly by confusing their respective tick-boxes. Personally I would prefer either, the tick box to the left of the the descriptive text, or the descriptive text to be right justified so that it is close to the tick-box. However these mistakes were discovered very quickly, well before switch on time.

From: Steve Drury
Topic: 1570 Message: 1570

Apologies folks but I can't make the net tomorrow morning, I'm out early.

If there is some one with a good signal (antenna) please take over the reins and keep the net going.

Looking through my logs there have been dozens of different stations participate in the net, when I have a minute I will make a "hall of fame" and name them all.

Regards,
Steve G6ALU

1571. PTT / Mike / Headset Tip.

Yahoo group: mkars80
Date: 2010-02-07 17:54:32 UTC
From: g3oth
Topic: 1571 Message: 1571

Hi All,

Here is tip I have just passed on to Alan G3WXI which some of you also might wish to consider.

I use a very cheap combined electret mike and 32 Ohm / phone stereo headset obtained for under £5 from a local Netto store with my MKARS80.
It originally had an in line potentiometer volume control situated about halfway along its cord.
I removed this and replaced it with an in line ON/OFF switch of the type used for small table lamps and re-routed the wiring inside it as follows:

1 Cut TIP wire coming FROM moulded green audio stereo jack and connect it to wire FROM electret mike.
2 Cut RING wire coming FROM moulded green audio stereo jack and connect it to FIRST switch terminal.
3 Cut SLEEVE braid FROM moulded green audio stereo jack and connect it to SECOND switch terminal.
4 Connect SECOND switch terminal to braid FROM electret mike.
5 Cut TIP wire FROM moulded pink mike jack and connect it to both wires FROM LHS and FROM RHS stereo phones.
6 Cut SLEEVE braid FROM moulded pink mike jack and connect it to braid FROM both stereo phones.

What you end up with is a nice dedicated moulded plug assembly comprising PTT, Mike and Mono 16 Ohm Phones ideally suited to the MKARS80 terminations.

Things to watch out for:

All the cheap headsets I have come across so far have had their mikes terminated with TPS (tip, ring, sleeve) jacks, rather than Mono jacks, in some of them the ring is either floating or connected to the sleeve, whereas in others the ring is shorted to the tip.
If the ring is shorted to the tip, you need to investigate further, before proceeding with the above mods.

Now remember GREEN for MIKE......PINK for PHONES......and don't try to use your headset with your PC again.

Trust this may be of some help.

Hi Jim yes i will photocopy it later on tonight and post it in the file section.
you will have to do the audio mod to get it to work. what i did was lift leg 3 on the audio ic and solderd a cable to it put another cable in the hole for the leg and one from earth to a 50k pot.take the audio from the input of the ic to drive the dcs2

1576. One new MKARS80 station in the air.. :)

Yahoo group: mkars80
Date: 2010-02-11 11:24:14 UTC
From: sm0yyq
Topic: 1576 Message: 1576

Hi all, my name is Mattias.. and my signal is SM0YYQ.

I have recently build my MKARS80 finished and i have had 4 QSO's with it at the moment.. :)

I have had 57-58 report's so far... but the conditions are not soo good at days in sweden..

I dont know how much power the radio deliver at the moment (i dont have a powermeter), but i have putted the current from about 271ma to 321-322ma.

So i guess it deliver som power anyway, one thing i have noticed is that the end transistor doesent sems to be warm, i cant feel any heat at all almost on the case.

Is that normal, cos i know my FT-817 i hade before become more warm whan whis... radio.

Hi Rob..

I havent messured the amp's whan i transmit.. only whan i messured the current..

And i have rised it to about 321-323ma from 271ma so i guess the end transistor pulling out the power it should.

I should try to messure the amp whan i transimtting also, to bad my equipment doesent have "peak and hold" but i maybee get a clue over the situation anyway...:)

Have talked to some longer distance today also, so it seems the effect find it's way out of the antenna.:)

Hi Mattias,

The unwanted side-band is typically 50dB down on the wanted signal which I consider to be completely adequate - the "typical" transceiver measured is mine of course but it is the same as yours!

Have you ballanced the carrier insertion mixer? If not this could cause your carrier to be transmitted.

Make sure the BFO is correctly adjusted at 10.000MHz and you should be OK, its easy to tell if there is a problem; tune into a very strong heterodyne (strong CW works), adjust the tuning slowly so that the tone gets lower in frequency and eventually goes through zero beat. As you keep tuning it will appear in the upper side-band and should be very quiet.... give it a try! If it is as loud then you have the problem he describes, if it is very much lower then his radio has a problem.

When talking the LED should only flicker off, if it stays off talk further from the microphone.

Could this amateur be jealous of you - you can talk to him with a ?50 radio but he is probably using a > ?1000 radio to talk back?

Mattias,

I agree with Steve's comments, check the set up. I have never received any negative comments at all on my MKARS80 contacts and I have had 100s. I suspect Steve's last paragraph is more likely to be the issue! Keep us posted.

Hi Again, and Steve also..

To Steve, must say im wery pleased with the build.. it was more easy whan i expected to make it work.. :)

I have messured the BFO to about 9.998Mhz, and i cant get it higher it seems.

I have also used my Softrock 80/40 kit to minimize the mixer signal, to as small i could.

I dont have a oscilloscope, so i thought whis thas the best way to make the adjustment..

And last, the amateur in my region.. yeah it may be much eisier to hear all the "bad" things as u get a realy strong signal into ur antenna.

He also told me before my commersial Yaesu FT-857D rig was to broad in bandwidth, yaya anyway i dont care what he say and i have also had reports telling me my build sounds well.

Hello Robert !
I agree with that for 100%..I`m very pleased with what my little MKARS are able to do.I`m ,like the rest of us i believe,interest in to improve things, just to suit my own purposes.No wrong with
that. It is a part of our wonderful hobby.I found it very interesting to follow how Hams create their own sollotion with one and the same object.

Hi Hasse, i would take what the other ham says with a pinch of salt, the audio on the MKARS80 is outstanding for a QRP kit, I have nothing but great reports. wonder what type of mic you are using?

1586. Display replacement.... :)

Yahoo group: mkars80
Date: 2010-02-18 14:27:07 UTC
From: Mattias
Topic: 1586 Message: 1586

Hi all..

Im asking if this display's is pincompatible with the one assembled with the kit, i have found two displays who seems to be compatible with the one shipped with the kit.

Only thing is what the ones i found have backlight also.. :)

I link the data pdf files for the displays..

First One:

http://www.kjell.com/filarkiv/SUPPORTPDF/81-90/90/90213/ATM1602B_datasheet.pdf

costs about £8.42 (99:- SEK).

And here is one with blue backround and withe labels.

Hmm, seems to be same PSF file here.....

Maybe Steve can answer to this .. i guess the Display following the kit is 1602F, but maybee whey are pincompatible..

If soo i will brought one and get backlight.. :)

From: Peter Fraser
Topic: 1589 Message: 1589

Hi Mattias

Your display looks compatible with the display supplied with Steve's NKARS80 kit. See data sheet here http://www.digchip.com/datasheets/parts/datasheet/371/PC1602F-pdf.php

Be aware that the LCD with backlight is 3 mm thicker so you will need to make changes when mounting the back lit display.

I'm looking to fit a back lit display to my MKARS80 but have not got a display yet.

Subject: [mkars80] Display replacement for MKARS80.?

Hi all..

I wonder if i can use this display...

http://www.kjell.com/filarkiv/SUPPORTPDF/81-90/90/90213/ATM1602B_datasheet.pdf

As a replacement for the display shipped with the kit.?

it hase a build in backlight so whats why i wonder.

and its also cheep .. costs about £8.42 .. (99:- SEK)..

the store also got a same display but with blue backround and white text :)

So steve, may u have a look at the PDF file and tell me if i can use what display on the kit.. :)

I have also been thinking about obtaining an LCD display with backlight. There is a wide range on an ebay site here:

http://cgi.ebay.co.uk/Character-LCD-Module-Display-16X2-1602-HD44780_W0QQitemZ200397282936QQcmdZViewItemQQptZUK_BOI_Electrical_Components_Supplies_ET?hash=item2ea89bde78

The datasheet is here:

http://www.egochina.net.cn/e-shop/ebay/Datasheet/JHD162A.pdf

Again, the pins looks to be compatible but I would appreciate any advice before I go ahead an order one from China!

Sorry I've got attachments turned off so you never got the data sheet - I should have known better!

As you have discovered most of these displays will work with the MKARS80 - watch out for the pin-out as some of them are different. The best way of driving a backlight is from the 12V supply with a series resistor - don't omit this or you will blow the LEDs. If you run the backlight from the 5V supply the regulator is likely to overheat and shut-down.

Hi Mattias et al - I fitted a back-lit display to my MKARS-80 because it is easier on my tired old eyes and because I had oneleft over from an earlier project. There is an image of what it looks like in my folder in the photos section.

However at the time I did not appreciate that the back-light would double the power consumed by the receiver. Not important if your are operating from the mains but significant if operating from batteries, so I fitted a switch to turn it off when the occasion demanded it.

The blue back-light sounds very cool and would fit in with my colour scheme very nicely!

Thanks Hasse, and all others for the answer.

And yes Hasse, i got ur E-Mail as well, and the display light up as a chrismastree on christmas. :)

I will look forward to brought myself one as well..

But i seems to also got an issue of my radio drifting in freq.
I hade some nice skeds whis evening with some hams in sweden and, i like talked about 2-4 mins each time it was my turn and some of whem complaing about my freq drifting. :/

Maybee it was me who lay hand on the vfo whan i turned som "nub" on the radio i dont know, but i havent had this sort of problem before.

My radio does even feel hot after long talks...

Can i make som sort of ventilation holes in the side of radio to get the "hot" air out.?

Hi Steve, .. Hot and HOT.. u will not burn ur fingers if u set it where the Q1 is placed i can tell u..

But if i use the radio and talk for a while the whole chassie gets warmer.. :) but not so u burn ur fingers. :)

The bias i messured 271 as current and justered to about 322-323.

Hi Steve, .. Hot and HOT.. u will not burn ur fingers if u set it where the
Q1 is placed i can tell u..

But if i use the radio and talk for a while the whole chassie gets warmer..
:) but not so u burn ur fingers. :)

The bias i messured 271 as current and justered to about 322-323.

/M

1600. New Radio Same Problem

Yahoo group: mkars80
Date: 2010-02-22 21:15:47 UTC
From: Jerome
Topic: 1600 Message: 1600

I finished another MKARS80 kit and have the same problem as before. I can only get 3.8 watts out and that is the same as the first radio I built. I though if I made another one I would get the 5 watts out like everyone else. I wouldn't think I would have made the same mistake on both radios. If anyone has any ideas please let me know. Everything tunes up properly according to the manual and I get good reports on the air.

3.8W to 5W is less than half an S point.
Don't wory about it.

Nigel, The only reason I want the extra power is because I'm trying to use it as an exciter for an ALS 600 amp and that extra output means a lot.

Assuming you mean the Ameritron ALS600 I suspect that you're going to need a lot more than an MKARS80 to drive it.
I know someone who has one and to get it to give 600W takes the better part of 100W drive power.

Jerome,

I asked a recent builder (who I know I can rely on) to comment on the output of his rig, the answer was:

"An accurate 5.4W on voice peaks at 14V DC exactly. 3.4W at 12.9V (from my gelce battery) all at 1:1 SWR"

Can you raise your supply voltage a little? Keep it under 15V though so you don't cook anything.

Steve,

I turned the power up to 14.9 volts and the output was 4.1 watts. I normally run it at 13.8 volts. I think that is close enough so I'll just run it that way. Thanks, Jerome

1606. Fuse blowing

Yahoo group: mkars80
Date: 2010-02-23 09:36:13 UTC
From: STEVE
Topic: 1606 Message: 1606

Had the radio working fine on receive on the test bench, boxed it up and the fuse blew - I don't think it was a short at Q1 to the case which suggests a new short somewhere else.

I've now taken it out of the case and also taken off the board supports (which link the two ground planes)

Can anyone tell me what resistance they see across the power supply leads to help me track it down? I'm now seeing one Ohm which can't be right.

No, 1 OHM is definitely wrong!

The resistance to expect is noted in the manual I seem to remember.

It was about 2K I think.

Check that the washers on the potentiometers aren't causing shorts to nearby tracks - I've seen this on a few radios.

Its strange that they don't normally come near any tracks but on occasion they can break slip to one side and short +12V to ground.

1609. Fuse blowing - panic over

Yahoo group: mkars80
Date: 2010-02-23 14:41:25 UTC
From: STEVE
Topic: 1609 Message: 1609

Hi,

Well, I stripped the board out of the box, took the display off and went over it with a fine tooth comb. I cut any leads that looked a little too long and got a small screwdriver and cleaned between any tracks that looked a bit dubious. Not sure quite where the problem lay but all sorted.

Upshot is that it is now working properly - all boxed up with a cheapy chinese base microphone off EBay (which came with two small rocks in a piece of Chinese newspaper to weigh it down!)

I aligned it as best I could and first QSO was (accidentally) with the 80m homebrew net just before lunch. I was congratulated on the audio and received 55-58 reports from around the UK.

So ... the congratulations really belong to the designers and not the idiot builder!

Well done and many thanks! I've just posted a pic and update on my blog at http://g0kya.blogspot.com/2010/02/mkars-80-lsb-qrp-transceiver.html

From: Simon Robinson
Topic: 1610 Message: 1610

Hi all

I have a couple of suggestions for components for your MKARS80!

Internal Speaker - Farnell sell a truly remarkable little speaker; the part code is 176-1629. The speaker is 8 ohms and will handle 1.5W. It is only 5mm thick and 25mm round so it will fit on the front panel between the board and the panel - mine is to the right of the display. The audio quality and power output of this beastie is remarkable - almost unbelievable. If you run the speaker with no case it has almost no output as the sound from the back cancels the sound from the front. Simply holding it in your hand, wrapping your thumb and forefinger round it in a circle makes it come to life; no need for a baffle.

Backlit Display - Maplin Electronics sell a display that is virtually identical to the one supplied with your kit except that it is slightly thicker and backlit. The code is N27AZ but to use it on the kit you will need to mount the board a few millimetres further away from the panel - watch your drilling for the side panel. Don't run it off the internal 5V regulator or the latter will quickly complain. Instead fit a resistor and switch and run it off 12V - you could fit another 5V regulator too.

I'm delighted with my MKARS80 - a bit fiddly to build with almost 50 year old eyes but I have a desk magnifier which is a godsend. It actually worked first time which is even better.

Thanks to the team at MKARS for a great little radio.

Regards

Simon M5POO/G8POO

"Steve,

Just wanted to let you know that the MKARS80 is fantastic.

Haven't switched a 'black box' on since my first MKARS80 QSO 2 days ago. Getting good 57-59 reports throughout Europe and I have just made my 60th QSO and a tally of 19 countries so far! Best 'DX' so far 4500Km.

This is fun!

Kind Regards

Carl"

I think he has had some success!

Hi Simon - I completed my MKARS-80 a couple of weeks ago and this speaker is exactly what I have been looking for. Do Farnell still have a minimum order charge for non-trade customers do you know?

I was a professional customer of theirs for some 50 years so with the dirth of retail component suppliers it is frustrating not to be able to buy from the trade distributors.

The bottom of the enclosure is earmarked for 10 x AA NiMH cells so I do not really want to use this valuable space for a large speaker.

Hi Alan

Handy to know that Maplin sell it too!

I☐ve had an account with Farnell for almost 30 years ☐ the website even allows me to order ONE speaker with free delivery ☐ I haven☐t tried paying with a card.

Based on how wonderful this speaker is I ordered another 5 from Farnell to keep ☐on hand☐.

Good luck with the speaker ☐ I used a ☐Q-Max☐ 7/8 inch cutter to make a nice round hole ☐ 1 inch would have been ideal but the smaller size seems to work just as well ☐ it seems size is not to important in this case ;-)

Best wishes

Simon M5POO

No – but Google says lots of companies still sell their kit.

My trusty Farnell do and also http://www.lawson-his.co.uk.

I’m sure RS Components have their own version – no doubt just rebranded.

Yes
Where are Q-Max these days?

You could check through the Farnell and/or RS catalogues for hole cutters,
I've purchased somethere, made by a German company.

Rob,
Sorry I hadn't got back to you sooner....

There will be a small amount of microphone audio coming out of the speaker - this leaks past the mute transistor Q3. You may try reducing the value of R5 to say 2K2 to turn it on "harder" - if you do let me know the outcome.

Now this comes about from me assuming everyone knows the shorthand for component values, explanation:

2K2 is the same as 2.2K Ohms or 22,000 Ohms, similarly 4n7 is 4.7nF or 4700pF.

Hope this explains?

1629. Croos Atlantic QSO

Yahoo group: mkars80
Date: 2010-03-05 00:04:01 UTC
From: Carl
Topic: 1629 Message: 1629

Delighted to be able to report to the group an excellent confirmed cross Atlantic QSO last night.

K6AAX/VY2 (Prince Edward Island, Canada) < > DA6TEC (Wegberg)

Distance 8909 Km
RST received: 55
MKARS80 at 3.5W on voice peaks (had voltage turned down to 13.5v)
Antenna: Doublet 50m long at 15m above the garden

Spotted on DX Cluster. This QSO has made my week!

You will get a small noise due to the IF stages and the audio amplifier. The high frequency noise can be reduced by putting a low value (1nF - 47nF) capacitor from pin 3 of IC1 to Gnd, please experiment.

Jerome,

Do you turn the power supply on with the radio connected? If so try turning
the power supply on and then connecting the MKARS80 to it.

I think you have two MKARS80s, do both do it?

1644. Calling all VK users!

Yahoo group: mkars80
Date: 2010-03-25 08:01:16 UTC
From: vk2jdp
Topic: 1644 Message: 1644

As there are a few VK builders out there, I have dedicated my MKARS80 to sitting on 3690 for a while to see who may pop up. It will be on from about 1930AEDT through to somewhere around 2300, every day, depending on what's happening.

Antenna is either a 1/4 wave sloper or a folded dipole, depending upon noise. The sloper has a lower angle but its real noisy. The dipole rarely gets more than 500km but at least you can hear.

This may give us some chance against the usual 80m bunch - many of which won't answer a CQ unless it's S9 ;-)

If 3690's taken, try 3695.

Regards,
Jon

1645. Low level Audio feedback on tx

Yahoo group: mkars80
Date: 2010-03-26 14:06:22 UTC
From: Phil Archer
Topic: 1645 Message: 1645

Hi

I have now got my mkars80 to transmit and receive but when I transmit I'm getting low level mic audio in the speaker.

When I first built the board I had a blob of solder shorting L6 to ground so there was no rf output at all but I still had this feedback (tx ok now offending blob removed)

If i probe pin 3 of the af chip i get lots off noise which stops as soon as the ptt is pressed.

so:
The af mute transistor works
Its not high level RF break through.

Any suggestions please

Phil G6AKK

From: Peter Fraser
Topic: 1645 Message: 1647

Hi Steve & Phil

My MKARS80 had objectionable level of noise. I am using a speaker/microphone and it feeds back and squeals.

I fitted a small DPDT relay directly from the microphone PTT that opens the speaker line and applies the PTT for the rest of the radio.

There is a photo on my blog at http://vk3zpf.blogspot.com/2010/03/mkars80-update-7.html although I believe there are other methods to achieve the same effect.

My BITX20 V3 had a similar problem that got the same cure.

1649. Re: Low level Audio feedback on tx

Yahoo group: mkars80
Date: 2010-03-28 00:18:53 UTC
From: vk2jdp
Topic: 1645 Message: 1649

Phil,

I'm with Peter on this one - use a separate contact to silence the speaker if you can. The transistor mute is fairly effective, but we have a gain of 200 after it!

<< I also tried the speaker/mic combo and it failed miserably!! >>

I have an inbuilt speaker, which caused feedback whenever I held the mic too close. The problem was actually that the mic was too sensitive. I noticed this fairly early on and had taken to almost whispering. Otherwise, I could barely talk without the TX LED going out!

I swapped it for a $2 el-cheapo mic insert, which has less sensitivity.

This worked (sorta) except I was still getting whistles and strange carriers on my signal when I operated portable (read: with a less-than-perfect earth). Turns out that the mic element was picking up RF, and adding a 470pF cap across it made it worse :-(

So now, I've wired the unused speaker element as a mic.

Voila! Why I didn't think of this earlier, I don't know =]

Its a bit un-sensitive, but as a result, the audio quality is much punchier. You don't have to yell, but it helps to hold the mic against your cheek.

PS Just got 2 evening's worth of QSOs out of a 9ah battery. This thing never ceases to amaze me!

Regards,
Jon

DO NOT OPEN THE ATTACHMENT IN THE LAST MESSAGE

The last message contains a virus so don't open the attachment what ever you do!

I didn't think I had file sharing enabled so I'm not sure what has happened here, I will attempt to turn off the ability to send files and will also ban the user.

If you don't already have a GOOD virus checker I would advise going to http://free.avg.com/gb-en/homepage and downloading AVG, it won't cost you anything and could save loss of data.

1652. READ FIRST - Propogation of viruses

Yahoo group: mkars80
Date: 2010-04-02 09:34:01 UTC
From: Steve Drury
Topic: 1652 Message: 1652

Propagation of viruses via the MKARS80 group

I've checked the group "settings" and according to Yahoo attachments should be "stripped" off all messages, I guess the virus got through because it some how fooled the Yahoo software into thinking it was part of the message body but Outlook worked out it was an attachment and displayed it as such.

To avoid the reoccurrence I have changed the settings so ALL emails will now be moderated by me, this will cause delay in you reading them but its obviously necessary to protect against the propagation of viruses.

Its a pity some people allow viruses to affect their computer - most can be prevented by using free software http://free.avg.com/gb-en/homepage .

DO NOT OPEN THE ATTACHMENT IN THE LAST MESSAGE

The last message contains a virus so don't open the attachment what ever you

do!

I didn't think I had file sharing enabled so I'm not sure what has happened

here, I will attempt to turn off the ability to send files and will also ban

the user.

If you don't already have a GOOD virus checker I would advise going to

http://free. avg.com/gb- en/homepage and downloading AVG, it won't cost you

anything and could save loss of data.

I thought I had protected ourselves by turning off the ability to send attachments but obviously not!

Oh well, it will wake the group up, its been abit quite recently! Just hope no one has been hit by the virus as it very nasty, I've had a look at the virus checker history and its Win32 Heur... found the following on the net:

"What is Win32 Heur Virus and what it can do to you

Win32 Heur Virus is a Trojan designed to get your money by any means. Some of them will show you fake security warnings and then offer you to buy their rogue antivirus. Rogue Antivirus is not designed to help your computer, instead it will harm your computer further, and it is very aggressive."

Yahoo group: mkars80
Date: 2010-04-02 10:05:04 UTC
From: Steve Bell
Topic: 1651 Message: 1656

As soon as I saw the attachment I suspected it was dodgy, and an exe file with no covering text even more so. No problem here as my emails only come down to a Mac running OS X, and the PC I just use for amateur radio software runs AVG as it connects to the web. I haven't seen anything like this for a long while.

Hi Steve (2E0SGB)

Yes it was sent to multiple groups and email addresses as the posted message arrived here showing them all in the CC line.

Also Steve (G6ALU) I see the post with the link is still on the board. As you're the owner moderator may I suggest deleting the message so no one accidentally clicks on it.

(Edit from G6ALU
Thanks, I thought I had deleted... obviously pressed the wrong button!
Steve)

Cheers all

Hi Steve & group.

I've just returned home after a short Easter break (in Milton Keynes actually) & saw the messages about the virus.

First of all thank you for pointing it out Steve but, unless I am mistaken, & that is very possible, it was just a link and not an attachment which means it would be difficult if not impossible to filter out.

I think we just need to be on our guard as usual.

Thanks again.

Hi Hasse,
I have looked at the datasheet for the BB212, and I think it looks like a suitable replacement for the MVAM109. You may need to adjust the value of the coupling capacitor to get the tuning range correct.

Steve,

Just looked at the Bill of material at http://www.radio-kits.co.uk/mkars80page.html

It shows two NPO and one NP0

No mention of the two 1nF NP0 though.

Thanks for pointing that out John, I've deleted the BOM (bill of material)
as it is out of date - it should have been updated when the manual was but I
forgot it was there!

The BOM is contained in the manual.

Hi Mark,

I'm not the author of that mod but I suspect the leakage is the most
important thing so perhaps a plastic type (mylar / polyester) type would be
suitable - perhaps VE3XJ would like to comment.

Steve

1678. Re: HELP I CAN'T FIND A 100NF NPO CAP

Yahoo group: mkars80
Date: 2010-04-22 20:30:08 UTC
From: panzerbeeb
Topic: 1668 Message: 1678

Hi Mark Steve and all,
The VFO mod I used was proposed by G8DIU. Here are copies of his 2 posts some time ago regarding his design:
QUOTE
Hi All, A great little kit, so thanks Steve.
Mod 1. Changing C59 and 60 from polyester to POLYSTYRENE
dramatically reduces the VFO drift.
Mod 2. By removing the Tuning capacitor and replacing it with a 10
turn 10K pot and 2 MVAM109 diodes in series makes tuning really
easy.Approx 100pf is needed to couple to the original Tuning
Capacitor point.A 1 meg resistor provides an earth connection, from
the junction of the top diode and the 100pF coupling capacitor.The
tuning voltage is fed via a 470K resistor from the 0.1uF capacitor
decoupled slider of a 10 turn pot. where the diodes are connected
togeter.
One end of the pot goes to the +8V stab . rail and the other end of
the pot is earthed. Get it the right way round means clockwise
rotation of the pot increases the 3.6 MHz frequency to 3.8 Mhz
Series Varicap diodes are connected together at their positive
connections, this is the 470K control voltage point and one neg. end
goes to earth, the old tuning cap earth connection, the other neg.
diode end going to the 1 Meg to earth Resistor and 100 pf point.
Good luck all
73
Brian G8DIU
QUOTE

and

QUOTE
Hi
Some words for guidance re Messagage 353.
Polystyrene Capacitors have a colour coded end, being tubular, that
denotes the outer foil. This should always be connected to the lowest
RF potential, e.g OV or earth if possible or as near.
The top coupling capacitor, from the Varicap. comprises a Ceramic NPO
22pF in parallel with a polystyrene 82 pF capacitor. Low value NPO
capacitors usually have a black panted top.
Series connected MVAM109 diodes are connected this way to prevent
forward conduction, due to high circulating RF voltages, that can
cause spurious responses and thus strange effects. MVAM109s are used
in Medium Wave designs so series connection halves their effective
Capacitance swing which is fine in the narrow band MKARS80 application.
I hope this of use/interest.

Hi.

If you are a GQRP member they have them for 50p each + 60p P&P per order.

I'm sure there must be other places but that's an easy one!

73,

John G4GCL

Hi all thanks for you're help i have just emailed Graham and asked him if he can sell me 4 as the magazine says only 2 you can buy.
Thanks again from Mark 2w0jmk

Hi Mark.

I read it as meaning you can only buy 2 of the BB105's which is how it appears on the website but looking at the latest SPRAT you are right.

Sorry about that [:(]

73,

John

From: mark
Topic: 1668 Message: 1685

Thanks all for the help I am now sorted (Good old Sprats to the rescue).

NOW THAT'S ALL I NEED NOW ARE A PHOTO OR TWO OF THE MOD HI HI

1686. MKRAS40

Yahoo group: mkars80
Date: 2010-04-30 11:13:00 UTC
From: zip
Topic: 1686 Message: 1686

Hi Steve & Fellow members,

Only just realised that I was still using a dead email account for the group, correct address now set.

Sorry if I'm going over any old ground, but where did we get to regarding the 40m mods or new kit?

Phil

From: Steve Drury
Topic: 1686 Message: 1689

All,

I tried to modify an MKARS80 to 40M but was left with a problem; the dynamic range wasn't adequate for use on 40M. While listening to a low signal amateur station broadcast signals could overload the early stages. This was easy to cure by having a separate volume control and increasing the audio gain but this gave two other problems; to do a "proper job" a new PCB was required and there was a loud thump through the speaker on TX / RX transitions.

I'm often asked for other bands; 160, 40, and 20M so have started development of a radio more suitable for general HF use. I can't give any more information at the moment as my thoughts are still evolving and only basic design and testing have been done. The MKARS80 will continue to be sold whatever happens with a new radio, there seems little point changing something that works so well.

1692. A simple AGC (Audio compressor)

Yahoo group: mkars80
Date: 2010-05-20 10:25:03 UTC
From: Bengt
Topic: 1692 Message: 1692

It's very unpleasant to work a weak station and strong staion is calling in, especially when you are using headphones.

I'm using an old trick, often used in Wienbridge oscillators in the past.

One 22 Ohm resistor is connected to speaker out. a lamp, 3V/50mA, connects between the 22 Ohm resistor and ground.
Parallel to the lamp is a 10k pot. The center of the pot goes to LM386 pin 2, You have to disconnect that pin from ground.

A lamp is in a sense a PTC resistor, thats why they does'nt burn up ;)

It will glow when there is a strong signal, which will increase the negative feedback with a lower audio gain as result!

The pot. is used to set the working point.

A side effect is that you can use the lamp as a simple S-meter.

This simple AGC will not cure very strong signals but it has made my QRP life a lot easier ;)

Hi,

I would just like to say a "public" thank you for a very interesting talk by Steve last night at the Peterborough club. It was interesting to hear the design concept relating to other QRP Kits.

Having built the MKARS80 Kit it was interesting to hear about the idea of introducing a slow motion drive to the "tune" control and also get an update to the PIC chip, as mine was a very early one.

Many Thanks

Alan G8XLH

From: Steve Drury
Topic: 1693 Message: 1700

Adrian,

You can use that SWR meter design remotely from the detector head without a problem but that code won't calculate power output. I had been working on a digital SWR / power meter but its been shelved while I look at other projects.

No progress on 40M I'm afraid - I decided it would need a new PCB so didn't take it any further.

From: Adrian Rees
Topic: 1693 Message: 1701

Hi Steve
Thanks.

I have found some other links which may provide some more information. I'm building 4 Square's for 80 & 40 and want to measure the SWR and Power being dumped into a dummy load. (I'm using the Collins method of Phasing). Hence a remote SWR and Power meter would be very useful.

Thanks, I'll continue my research.

1703. Deaf Rx

Yahoo group: mkars80
Date: 2010-06-16 15:58:57 UTC
From: g0wbm
Topic: 1703 Message: 1703

Hello All,
I'm new to the group, names Ken , call g8beq Glossop, Derbyshire.
I;ve just built the MKARS80 V1.3 and find that there is almost no
signal comming through the Rx [not got round to testing the Tx yet hi].
There seems to be a very high loss in the crystal filter. I can just
about detect noise from the speaker but if I bypass the filter there is quite a noticable
increase in noise. If I feed a sig genny into the filter there appears to be over 20dB
loss, this seems a bit high, I would appreciate comments from any who've measured the
filter loss.
I need several mV input into the filter before I can hear anything.
I have tried bypassing each crystal of the filter individually without
any effect. The sig genny set to give a certain level of audio when
injected across the back to back diodes on the OP of the filter is barely detectable when
tapped into any of the crystals of the filter.
Any comments welcome.
73 Ken g8beq

Topic: 1703 Message: 1704

Ken,

Make sure none of the crystal legs is shorted to ground - this can happen if too much solder wicks up the crystal lead - simply measure each crystal pad to ground.

A more likely cause is a poor soldered joints on one of the mixer transformers; make sure the enamel has broken down on all of the connections allowing them to solder properly.

Regards,
Steve G6ALU

From: K.Greenough
Topic: 1703 Message: 1705

Hello Steve,
I did consider that one or more crystals could be shorted to
ground but they all show open circuit [to ground] when checked.
When building up I did consider putting some PTFE spacers
under the crystals, I've got lots salvaged from PMR sets etc, but
I couldn't find them hi. If you saw my garage you'd understand that.
OK on the transformers. I did check each winding for continuity
when building but I'll certainly check again. That said, I need to put
over 100mV into the filter input to hear anything in the speaker.
A couple of mV on the filter output is deafening. And the transformers
are before the filter.. I'm very impressed with the quality of the kit by the
way, my friend, Keith g8inc, ordered kits for himself and myself just a
few days ago. However there a lot of components and the chances of me
having made a mistake are high. I've put it to one side for a couple of days
and then I'll look again with fresh eyes hi.

1707. MKARS80 on ebay

Yahoo group: mkars80
Date: 2010-06-17 12:15:38 UTC
From: hamlab3
Topic: 1707 Message: 1707

Interesting to see there is an MKARS80 on ebay - looks well made and with an un-assebled CW adapter.

ebay number 220622020641 .

Steve

1708. Hi, new builder

Yahoo group: mkars80

From: zaktherabbit
Topic: 1708 Message: 1708

Hi All,

just bought the kit, extremely impressed by the excellent quality of the PCB. Had about 3h at it so far, but most of that was casually doing a check-count to ensure everything was complete. Just about to start winding the trifilar transformers.

Thanks to Steve for great service, and a bit of friendly banter as well. Kit arrived virtually next day (ordered late evening)

Looking forward to getting it on-air

Martin G7MRV

1709. T1,T3 Which way up on circuit board?

Yahoo group: mkars80
Date: 2010-06-21 19:20:18 UTC
From: richard_forss
Topic: 1709 Message: 1709

OK, Got this far without incident. About to solder T1 and T3, but not indication of which way around these go on the PCB.

Am I missing something? Does it matter? The manual clearly shows how to install T4,T5 and T6 transformers, but does not shwo the same detaul for T1,T3.

Thanks in advance...

Richard Forss M6IXI

Hi Richard,

I didn't make it clear in the manual - it doesn't matter which way round
they go as each side has 5 turns.

Regards,
Steve G6ALU

Think I figured it out. No need to worry about orientation as it has the same windings either way, Just looked at photo and I'll put A on left and B on right.

1713. T4 a little 'untidy', should i rewind?

Yahoo group: mkars80
Date: 2010-06-22 22:36:42 UTC
From: zaktherabbit
Topic: 1713 Message: 1713

ive just realised, long after soldering in, that one turn on my T4 is not as tight into the core as i'd like, it sticks out a little either end. Not a lot, perhaps a quarter of a millimeter, just enough to be noticable. (these are the first trifilar bino cores ive ever wound, only ever done toroids before)

Is this likely to have an adverse effect on performance? my concern being that this is one of the two transformers for the diode-ring mixer, which of course must be balanced.

Is it ok, or should i pull it and rewind it?

Regards

Martin G7MRV

From: Naqoyqatsi (aka the ICM)
Topic: 1707 Message: 1716

Hi Steve.

The same guy has had 2 'partly built' ones on there recently which kept being relisted at lower prices.

They seemed (after photoshopping around with his cr*p pictures) to be missing substantial numbers of parts. One appeared to have no crystals and one was missing most of the inductors. Neither seemed to have the PIC or display
I mailed him twice about them and their state of completeness and he never bothered to reply.
Hey ho - that's the joy of EeByGumBay I guess :-)

fair enough! although im sure yours must be tidy, with so much more experience behind them. After winding those little beasties i actually enjoyed winding the toroids!

Just need to find a mic now, ive put the 'feelers' out at work, must be something lying about...

Any electret microphone (or low impedance dynamic with 1uF in series) will work - we use desk microphones intended for computor use but you need to wire to a new plug and add a PTT.

1719. Re: cheap speaker-mics?

Yahoo group: mkars80
Date: 2010-06-24 17:46:56 UTC
From: zaktherabbit
Topic: 1713 Message: 1719

Im hoping to get hold of a smallish speaker-mic, the sort used with handhelds. Annoyingly, there arn't any about at work, which is really annoying since we supply comms to most of the emergency services! You'd have thought there would be one kicking about!

I have PC type telephony headsets spare which will do for a test mic

ive seen cheap, obviously chinese import, generic speaker-mics for sale online, i wonder if anyone on here has made use of one of these? and if so how do they perform?

The only other mics i have spare are for older handhelds and radios, like pye and philips, which i'd rather not chop the plugs off

1720. Re: deaf Rx

Yahoo group: mkars80
Date: 2010-06-24 19:47:21 UTC
From: K.Greenough
Topic: 1720 Message: 1720

Hello Steve,
You may remember my previous emails regarding extremely
quiet signals from my MKARS80 V1.3 , I checked and rechecked
many times all components and connections, especially the
transformers but all to no avail. I could receive SSB, quite nice sounding
audio but almost none of it. I had to place the speaker next to my ear to
hear anything at all. To be honest I was on the verge of throwing the set
in the bin. So I started to study the circuit and was amazed that R18 the
base biasing resistor for Q6, the audio preamp, was only 1K ohm. Q6
was turned on so hard it was near enough saturated, sure enough on the
voltage chart in the manual Q6 is shown as having 0.6v on the base and
0.6v on the collector. I tacked a 100K in series with R18 and switched on.
The audio nearly blew me across the room. The Rx is nice and lively now,
there's a contest on 80 at the moment and the set copes very well with all
the activity. What I don't understand is how others have got their MKARS80
to give any audio out. Anyway, that's the fix I found and now I'm happy with
the Rx, time to check the Tx hi.

Ken,

You are quite correct, for a properly biased stage you don't have a 1k bias resistor, this was a design faux pas! This is essentially a waste of a transistor but removing it would have meant a new PCB design, the transistor only costs me 2 pence.

All working MKARS80s have this 1k resistor.. indeed if any one doesn't think they have enough audio they are welcome to change the value of resistor but only after the radio is working properly, believe me with a reasonable aerial you should have plenty of audio.

I'm sure your problem is elsewhere, I'm guessing that you won't get much power out in TX; if this is the case I urge you to send it to me rather than putting it in the bin.

Regards,
Steve G6ALU

Hi Ken

A most interesting observation that you have made.

Did you check the voltages of C, B and E of Q6? I also wonder if you have the correct value for R15 of 4k7?

I was trying to find a way to mute the audio amplifier when using a speaker mic and finished up using a relay, but perhaps saturating Q6 would have been a better way?

Good luck with the transmitter.

Topic: 1720 Message: 1723

Hi Steve and Ken
Quickly looking at the circuit around Q6, I estimate it is biased at approx 2.5 mA when fed from the 1K0, although I would have thought that the collector volts could be close to the base say within (2.5 mA / 100) x 1K = 25 mV assuming a gain of 100, the transistor will not be saturated and therefore should still amplify. The gain of that stage could still therefore be as much as 4K7 / (25mv / 2.5 mA) = 470 if simple maths and physics holds true.
Steve do you remember the problem I had last year with the LM386 when the coupling electrolytic between Q6 and its input went leaky ?
I posted the symptoms and remedy if you look back at that msg.
I am just wondering if something similar might be masking Kens observations. Worth a look at Ken, because as Steve says all our MKARS80s use 1K0 and have heaps of AF gain.

Should add that my calc was based on potential open loop gain, the feedback resistor would make a difference when closed of course and hence lower it somewhat depending on the drive impedance, but I think my argument still applies.

Maplin stock quite a reasonable speaker mic, with 30mm diameter 8 ohms speaker with an electret mic insert. Priced at £9.99. The shop code is QT21X.

http://www.maplin.co.uk/Module.aspx?ModuleNo=29693

Hope this helps.

From: K.Greenough
Topic: 1720 Message: 1727

Hello All.
Well it's good to get so much feedback to my posting.
OK Steve on the fact that you feel I still have a problem
elsewhere, this obviously could be so but I can't find it hi.
A chart showing signal levels after each stage with an input
of, say, 2uV from a sig' genny would make fault tracing much
easier. I will try the Tx tomorrow and we'll see what happens then.
To you Peter, yes I checked the voltages on Q6, they were as
quoted in the manual. If you want to mute the Rx then Q3 already
is provided for this purpose. If you put a diode in series with R5
you can feed a voltage to Q3 base and it will mute the audio amp,
the diode stops your voltage from powering the Tx stages.
Charles, I'll certainly check the cap' [Q39] in the feed to Q6 but the
DC voltages measured on Q6 were as quoted in the manual.
If you were to short the collector of Q6 to its emitter [ground] then
12v across R14 and R15 would pass 12/4920..... 2.44 mA ,
With Q6 in circuit the current is 11.4 / 4920 ..... 2.3 mA so it's
obviously turned on fairly hard. It actually represents a resistance of
260 ohms as the lower part of a voltage divider with R28 [10K]
So it's a very effective attenuator.
As a further, interesting to me, point. My friend Keith, g8inc, ordered
two kits, one is mine and he's just built up his. He has exactly the same
performance as I have [he's going to change R18 tomorrow hi]. It seems
very unlikely that we would both make exactly the same mistake in the
construction of the set, we built them completely seperately.
Ah well, I'll check the Tx in the morning and take it from there.
Thanks for the comments, all very welcome.

Ken

May I make a suggestion?

If you and you friend both have the identical problem on your respective MKARS80s then ship one of them back to Steve to let him run some tests.
It may be that there is a common problem with a component value or specification in the latest parts that Steve's shipping (only a thought)

Hello Slim,
OK on your suggestion but to be honest it goes against
the grain to admit defeat hi. That said the Rx is working
fine with R18 upped to 100K . So whatever the other fault
[if there is one] is it only reduces gain, not the performance.
I'm about to check the Tx now so I'll see what I find.

Yes I think that would be a good addition to the present excellent builders guide. Maybe it could be incorporated into the schematic showing either typical actual signal levels or as dB gain or loss progressively or at each stage as in the N7VE Schematic for the BITX20A

>I will try the Tx tomorrow and we'll see what happens then.

Ken, I think Peter or someone else had some problems earlier regarding this muting feature and is aware of some of its limitations and use, however you do not need a diode as Q3 is switched on via R5 by the switch TX12v supply on the PCB already.

> Charles, I'll certainly check the cap' [Q39] in the feed to Q6 but the

Excessive cap current was a long shot, it certainly was the culprit for the LM386 not behaving as expected but it would have to be really bad I guess to influence and control Q6

I would rather not use those words as they imply the transistor is saturated, which even with 0.6 volts at the collector IMHO it is not.
To be saturated my understanding is that VCE would need to be lower than VBE, the fact that base current has to be provided via R18 from VCE ensures this situation can never exist.

> It actually represents a resistance of
> 260 ohms as the lower part of a voltage divider with R28 [10K]
> So it's a very effective attenuator.

If this refers to Q6 I am not quite sure what you are getting at here.
It seems to me that it is more appropriate to describing the functioning of the muting

transistor Q3

Hello All [who're interested hi]. I've checked the Tx and I get
5 watts output on a whistle so that seems OK, I do have a
problem that is likely of my own making, the audio doesn't
mute fully on Tx, this may be because I've upped the gain
of Q6, it could be that turning Q3 on a bit harder will do the trick.
Of course if I could find the possible fault on the Rx I could dispense
with the extra gain however I can't find anything wrong with any other
stages. Steve mentioned that there should be plenty of audio with
a decent aerial. What is a decent aerial ? at the moment I'm using
about 20 metres of wire from my garage window up to a 8 metre
high pole at the bottom of the garden. This is roughly a 1/4 wave sloper
on 80m . Not the best but should produce reasonable reception.
This wire fed into commercial sets gives good results. I can now detect
band noise when I connect the aerial which I could not do before I changed
R18. The noise levels here are fairly high so they should be noticable hi.
Carrier suppression is good, I can just detect the carrier using a FT817
close to the set, and it's not boxed yet so it's good. That said R59 and
C103 don't seem to have much effect but as the balance seems good
I'm not too concerned.

It is normal I think to detect a little bit of "side tone" on TX for reasons I stated earlier. In my case it is not a problem and is barely detectable when using Steves recommended R values.

> Of course if I could find the possible fault on the Rx I could dispense

I wish we could get to the bottom of this problem.

That antenna is more than good enough for RXing on the MKARS80

> This wire fed into commercial sets gives good results.

The MKARS80 should perform equally as well regarding sensitivity.

>I can now detect
> band noise when I connect the aerial which I could not do before I changed
> R18. The noise levels here are fairly high so they should be noticable hi.

The MKARS80 is usually very quiet until you attach a few feet of wire to the antenna socket, 6 feet is about all you should need to bring in some noise.

Hello Charles,
Thanks for the comments, my comment about a diode and Q3
were addressed to Peter who said he was using a relay to mute
the Rx when using a speaker / mic. I was thinking that he wanted
to mute the Rx without the TX being operated [I read it wrong hi]
and of course if you just put a voltage to Q3 whilst on RX it could
feed back into the Tx circuitry. All a complete misunderstanding on
my part. However now that I've tested the Tx, which is working fine,
I'm finding that the mute isn't good enough, I assumed it was because
I'd increased the gain of Q6 considerably but from your comments it
looks as this is a problem area. I'm thinking of reducing R5 from 10k
down to 4k7 . This should turn Q3 harder on [sorry, you don't like that
expression hi] and hopefully mute better. There will still be just over
2mA of base current on Q3 so it should cope.

Ken,

I'm glad the TX is OK, that does suggest both the mixers are also OK. If you have a scope follow the set-up information for the modulator ballance - I place it into TX with no audio and 'scope the FET drain then adjust R59 / C103 for minimum carrier.

Does the TX LED flicker off if you talk normally about 6" from the mike?

Probably of more help would be the required injection level at certain points for an output of say 100mV P-P at the speaker terminals, do you have a signal generator?

Hello Steve,
Yes, I have a signal generator so if you could provide the
levels needed at various points through the circuit to give
a known output [I can measure audio output power down
to milliwatts], I could find the stage at fault. Yes the red
LED flashes at ordinary voice levels. I tried reducing R5
to get better muting without any success and then I wondered
why the LM386 is powered during Tx. If it's supply was switched
by RLY1 there would be perfect muting, is there a reason why
it's left powered?
I'm not criticising the circuitry, far from it, I think the kit is very
good but we all have our preferred means of doing things.
In trying to find where I'm losing gain on Rx [before changing R18]
I note that C21 and R9 on the mic amp are across the detector
output on Rx, 1uF and 1k must shunt a fair amount of audio,
especially higher frequencies? rather like a severe tone control.
Both the RF amp Q19 and the 1st IF amp Q15 have 1K resistors
as part of the bias circuitry, this seems a rather low value to be
in parallel with the inputs? I would appreciate your comments on
these ramblings hi.

I have no problem with using that expression here Ken, as here Q3 is required to be and is already likely to be fully saturated, but no harm will be done by increasing IB, however I doubt if it will improve the level of muting by very much as the stage is already in saturation.

73 de Charles G3OTH

Steve is the best person to answer this, but it could be tied up with the desirability to avoid audible switching clicks & plops etc whilst the LM386 is settling down into its steady state.

Hi Ken,
My answers:

"I wondered
why the LM386 is powered during Tx. If it's supply was switched
by RLY1 there would be perfect muting, is there a reason why
it's left powered?"

This is the way the BITX20 works but you get a loud "POP" through the speaker on TX-RX transitions.

"I note that C21 and R9 on the mic amp are across the detector
output on Rx, 1uF and 1k must shunt a fair amount of audio,
especially higher frequencies?"

The detector is low impedance so there won't be much loss.

"Both the RF amp Q19 and the 1st IF amp Q15 have 1K resistors
as part of the bias circuitry, this seems a rather low value to be in
parallel with the inputs?"

The input impedance of these stages is again low (ideally 50R) so the low value of bias resistors doesn't cause much attenuation.

Best to get this fault sorted before you make any modifications to the radio.... they do work well as standard! I'm busy over the next couple of days so won't be able to get you the signal generator settings for a while - I suggest you re-check voltages on transistors especially Q19, remember its an MPSH10 with a different pin-out to most.

If you tune to a strong signal you should be able to follow the waveforms through on the scope, parts that must be OK (as the TX is working) are both mixers and the crystal filter. We've had one case of a broken RF gain control - make sure its not O/C, Charles had a leaky C35.

One problem I've seen a few times is broken print on component pads - when trimming the leads its quite easy to stress the pad and cause a very small fracture to the adjoining track. The only real way to find these is by scoping a signal through, typical places for this to happen are on decoupling capacitors, C87 for instance.

In the group file section there is a plot of the bottom copper layer if you need to do a comparison.

All the best,

Steve

Hello All,
Well I do feel a fool, I found the problem with my set,
it turned out to be poor soldering as the manual suggests.
I was checking the BFO frequency when I noticed that as
I put my counter probe onto the 10 MHz test point the
received signal went louder, I couldn't see why this should
be [and still not sure why] but it made me check the BFO
circuitry. When I checked the voltages on the buffer transistor
the set went extremely loud. There was obviously a cold solder
joint. I resoldered the pads and the gain of the Rx was way over
the top. So I changed R18 back to 1k [with a very red face] and,
hey presto, one Rx working as I'm sure it should. I do apologise
for leading everyone around the garden path. I've just got to check
the Tx again tomorrow to see if there is less feedback now that the
AF gain is back to it's design value. It's a surprise that the Tx gave
5 watts with hardly any BFO injection, that lulled me into thinking all
was well around the balanced mixer. Oh well, all's well that ends well.
Thanks for all the interest and advice given, much appreciated and
you were all correct about not needing the mod's I did [and now undone].

Hi Ken
I read your email and was very pleased to learn that you found a dry soldered joint was responsible for the lack of gain in your MKARS80.
Now that all is well I am sure you will be very pleased with it.
I and many others consider it to be the best value for money kit produced for a very long time having a performance that far exceeds most people's expectations who have not operated one before.
Have fun, and someday I look forward to working you for a 2 way QSO using our MKARS80s.

1742. mod for dynamic mic?

Yahoo group: mkars80
Date: 2010-06-26 13:07:32 UTC
From: zaktherabbit
Topic: 1742 Message: 1742

ok, i give up, ive searched posts, and files, but cant find the mod for a dynamic mic. (incidentally the search function wouldnt work for me, i had to read the post headers)

Im sure there was a post mentioning modding a dynamic mic using a resistor and/or cap, as opposed to the mod in the construction manual to remove the bias resistor?

I would rather mod the mic, since i will get a nice more modern looking and electret based mic at a later date

can anyone point me in the right direction?

Cheers

Martin G7MRV

From: zaktherabbit
Topic: 1713 Message: 1743

Thanks for the replies chaps,

thanks especially to the chap who pointed out the feedback problems of a speaker mic, i do apologise but i inadvertently deleted the email so i cant remember who it was, but for clarification, i was looking at that sort of speaker-mic fromt he size point of view, it is my intention to disable the speaker

anyway, a friend has just chucked me a new old stock CB fistmic, nice and tidy, but of course dynamic. I believe there is a mod listed somewhere on here to use a dynamic mic so will dig that out

My transceiver is now at first test stage. Fingers crossed!

From: K.Greenough
Topic: 1742 Message: 1744

Hello Martin,
If you don't want to remove R17 to use a dynamic mic you
could just lift one end off the board and put it back when you
get an electret mic. If you really want to mod the mic you just
need an electrolytic cap, say 1 or 2 uF in series with the mic
connection. positive end to the radio. You could get noise
introduced though if the electrolytic has significant leakage.

From: v321uk
Topic: 1745 Message: 1745

The mkars80 is great but if you would like to try 20m SSB I am selling my BITX20A 10 Watt SSB transceiver.

The kit is finished and working. This is just the completed BITX20A PCB so you will probably need to find your own case or chassis to mount it in. It is working fine on TX and RX.

Any questions please ask.

£50 Plus postage.

From: zaktherabbit
Topic: 1742 Message: 1746

Thanks for the replies chaps, that was exactly the info i was looking for,

Ken - thanks for the info regarding induced noise. I wasnt going to mod the radio, but i do have some very small PCB mount slide switches (like singles of DIP switches) so i will probably lift the resistor and install one of these switches in series, so then i can quickly put it back to bias when needed

cheers

Hello Charles,
Thanks for your comments, yes I agree the kit is
excellent value for money and is a high standard.
Even when I was having problems the quality of
the kit was evident and the problem turned out to
be of my own making. I look forward to meeting
you on 80m some time. I've got to get aerials
sorted out first, I did have an end fed [against ground]
inverted v about 120ft long and 40 ft high in the centre
but my wife had the tree cut down that was the support
at one end so I've got to come up with something different hi.

1749. Speaker relay modification

Yahoo group: mkars80
Date: 2010-06-27 10:05:16 UTC
From: Peter Fraser
Topic: 1749 Message: 1749

Hi all

I have posted details of my modification to remove the audio feedback that I was getting when using a speaker/microphone to my blog at http://vk3zpf.blogspot.com/

I found this modification was required as the small amount of audio that was getting through was enough to feedback but only when using a speaker/microphone.

When using separate microphone and speaker the modification is not needed as the muting of the receiver is enough.

1750. Quick tip

Yahoo group: mkars80
Date: 2010-06-30 14:46:06 UTC
From: zaktherabbit
Topic: 1750 Message: 1750

Probably been said before, but if your wanting to put an insulator between the LCD module and the main board, plastic of just the right thickness and rigidity is readily available in the form of flora butter tubs! A 4cm x 8cm rectangle cut from the side, away from the corners is what ive used, held to the LCD module by a few squares of PVC tape

Oh, and if you use a salvaged part from your junk box, test it first! I had a lovelly little rocker on/off switch. My MKARS wouldnt power up, despite the voltages testing find before i fitted the switch and speaker! The switch contacts were duff. Im really annoyed now 'cos i havent any more little rockers!

From: zaktherabbit
Topic: 1751 Message: 1751

Hi Chaps,

very pleased to report that my MKARS80 is sat on the shack desk, gently hissing away. The power switch is now a cheapo toggle, but thats temporary!

Im rigged to a 10w dummy load as i have no HF antenna up at present, but will go to the rx longwire shortly to have a listen, once ive netted the BFO on the 'counter

I have two questions -

1. Ive adjusted the VFO coverage using C38 and the trimmers on the polyvaricon, and i get 3.450 - 3.859 (with the fine control at extreme each side). These seem a bit over the top, giving a fair amount of the range where its not useful. Has anyone made any mods that reduce the overall coverage down a little, say to 3.49 - 3.81 ? Shouldnt be much more that adding a little extra parallel capacitance.

2. What have people chose for the internal loudspeaker, if used, and how positioned? (assuming standard case). Im testing with a 2.5inch speaker, which i think would be too large to keep the magnet away from the VFO. I have a 1.5inch ultra-thin membrane loudspeaker (3mm thick!) which im thinking of using.

I'd love to hear peoples opinions on these two questions

Cheers

Martin

1756. Re: [mkars80] 2 questions - speaker choice and VFO coverage adjustments

Yahoo group: mkars80
Date: 2010-07-04 09:44:41 UTC
From: Clive Reynolds
Topic: 1751 Message: 1756

Hi Martin

I reduced the tuning range by fitting a silver mica 47pf capacitor across the tuning cap. Now get 3.58 - 3.85MHz; I didn't bother with coverage of the CW end of the band but left a bit just above the top end of the European allocation to listen for region 1 stations.

I don't think you'll have to worry about the field from the speaker as most of the small speakers are well shielded.

1757. Problem with audio volume and power supply question.

Yahoo group: mkars80
Date: 2010-07-04 18:45:09 UTC
From: Richard Forss
Topic: 1757 Message: 1757

Hi,

Finished construction and managed to pick up a contact on it. It was very faint, but clear enough to prove the receiver was working. However, I'm having an issue with audio volume. When first powered up, I get a loud whistle at either end of volume range. Also no volume change over the range except for the last few millimetres of movement.

I am concerned that the power supply I'm using is incorrect. I'm using a mains power supply (from an old Netgear router) that is rated at 12V 1.2A. However, On the MKARS80 display, it is showing 14.3V. Is this any concern, or should I get a properly regulated 12V power supply? I just want to eliminate the power supply as a possible cause of my audio problem.

I've done voltage checks (against ground) on the pins of IC1 and get the following:

1: 1.36V
2: 0
3: 0.0091V
4: 0
5: 7.28V
6: 14.14V
7: 7.18V
8: 1.35V

These seem within range apart from pin 6 which seems a little higher than the 13.8 specified.

Hope someone can point me in the direction of a few tests that should point out the fault with my construction. I'm currently checking every soldered joint for short circuits etc.

Many thanks,

Richard M6IXI

1758. Re: [mkars80] Problem with audio volume and power supply question.

Topic: 1757 Message: 1758

Richard,
I'm not sure why the volume isn't changing whilst adjusting the RF gain - can you check it's a 4k7 potentiometer first by reading its value printed in the plastic and then measuring it with a meter.

The IC voltages are all probably reasonable - I would find another 12V source to eliminate the Netgear power supply as its probably a switching converter which may generate noise, 1.2A will be marginal when you are transmitting and it may not like the presence of RF power.

By far the most common problem is with soldering the transformers; the enamel needs quite a bit of heat to "burn" off so its wise to go over these with a good hot iron.

Let us know how you get on.

From: K.Greenough
Topic: 1757 Message: 1760

Hello Andrew,
I mounted my VFO coil on a small rubber pad and
put a dab of Evostick on the bottom of it and on all
the coils. The radio is not very microphonic.
I also used as short as possible lead lengths on
coils and transistors. What I have is a couple of
sproggies on Rx, quite low level so they don't bother me
but I'm a bit puzzled where they are being generated.
They vary in strength with the RF gain pot but not when I
short the aerial socket, got me puzzled hi. Possibly
harmonics of the VFO beating with the BFO or it's harmonics.

Thanks Clive,

is that range with the polyvaricons trimmers fully meshed? did you measure the range with them un-meshed at all?

I'd like to keep the CW section, so will adjust mine to cover that. The only major mod i'd like is probably not possible with the PIC used, which would be to have USB available!

I used an ultra-slim membrane speaker in the end, fitted to the side of the case.

Not tested Tx on air yet, need to get an 80m antenna up, but having a new baby means not much time for that

Subject: Re: [mkars80] Microphonic

Hello Andrew,
I mounted my VFO coil on a small rubber pad and
put a dab of Evostick on the bottom of it and on all
the coils. The radio is not very microphonic.
I also used as short as possible lead lengths on
coils and transistors. What I have is a couple of
sproggies on Rx, quite low level so they don't bother me
but I'm a bit puzzled where they are being generated.
They vary in strength with the RF gain pot but not when I
short the aerial socket, got me puzzled hi. Possibly
harmonics of the VFO beating with the BFO or it's harmonics.

From: Clive Reynolds
Topic: 1751 Message: 1764

Hi Martin

I think from memory that the trimmers were fully meshed. Try a 39pf and perhaps unmesh the trimmers slightly and see what range you get. I certainly found that the bandspread effect you get made it much easier to tune without going to the trouble of fitting a ten turn pot and a varicap diode.

Thanks Clive,

is that range with the polyvaricons trimmers fully meshed? did you measure the range with them un-meshed at all?

I'd like to keep the CW section, so will adjust mine to cover that. The only major mod i'd like is probably not possible with the PIC used, which would be to have USB available!

I used an ultra-slim membrane speaker in the end, fitted to the side of the case.

Not tested Tx on air yet, need to get an 80m antenna up, but having a new baby means not much time for that

1765. LED on transmit

Yahoo group: mkars80
Date: 2010-07-10 23:29:01 UTC
From: ei8ggb
Topic: 1765 Message: 1765

Sorry if this question has been asked elsewhere on this group, but could someone please explain what exactly should the modulation led be doing on transmit?
I have noticed that my led lights up constantly or flickers or goes out completely depending on how close I speak into the mic. What should it be doing in normal operation?
Is the led used as a meter of sorts?
Once again sorry if this has been already covered.
Many thanks.

Talk loud enough so the LED flickers On and OFF during speach - it monitors saturation of the output transistor. The LED should not be permanently off and for best TX power not permanently on.

From: K.Greenough
Topic: 1768 Message: 1768

Martin said he'd like to be able to use USB [not sure why
on 80m hi], I suspect that all that's needed is to change the
BFO crystal, it's 10 MHz for LSB so I would guess that
9.006 MHz or close would give USB. It wouldn't be hard
to switch crystals.

Hi Ken,

I wouldn't advise inverting the sideband as the filter shape isn't realy suitable, if he wants USB for PSK31 use don't worry as it will still work on LSB.

An 9.006MHz would be useless since the filter is at 10MHz.
What he needs is to insert an inductor in series with the crystal so that he can pull it down to around 9.998MHz or so. This also depends on the filter shape, in this transceiver I'l guess it is made to have as much oposite sideband supression as possible, and in that case it may be useless on USB. Given that, most digimodes work both in USB and LSB, for PSK31 make sure you use BPSK31.

Hi Chaps,

just to clarify, my interest in USB would be to listen to the maritime signals occasionally found on 80m (mostly coastguard stations), although it sparked an interesting discussion on the use of this set for digimodes

but as Steve has pointed out the filter shape isnt suitable.

Actually at the moment i'd settle for managing to get an antenna up so i can actually use the rig!!!

It doesn't matter if it is upper or lower if you are decoding the signals then you can transmit the signals.

The data doesn't care what mode it is employing to get around the world it just wants too travel.

1778. Re: Digest Number 430...QPSK vs BPSK Sideband

Yahoo group: mkars80
Date: 2010-07-17 22:02:49 UTC
From: Ken
Topic: 1775 Message: 1778

When using BPSK mode, the sideband does not matter. However, if
you're using *QPSK* and copying a station and call them,
you must be on the same sideband, or your transmit
signal will be off frequency, and you'll end up chasing
each other up or down the band.

While the de facto default for QPSK is USB, Digipan software
allows you to use either USB or LSB for
each band. At the top of the screen click
on "Configure". On the drop down menu click
on "Band", and it will display Band Properties
for Tone, USB, LSB, as well as Spectrum Display
Start Frequency for the waterfall. Be sure to click
on "Activate" (to the left of the Band list) then "OK"
when you are finished making your settings.
Happy Warbling!

1779. Mounting Controls & Display Off PC Board

Yahoo group: mkars80
Date: 2010-07-18 03:25:15 UTC
From: Ken
Topic: 1779 Message: 1779

Hi: I was in an electronics shop downtown today and saw some very nice alternative enclosures for the MKARS80 kit. Found some very nice colorful backlit 1602 type backlit LCD displays as well. Nothing wrong with the enclosure that came with the kit of course. But I like the performance of the basic unit so much that I would like to use the MKARS basic board as part of a larger "transceiver project" with more features. I plan lto add the CW Adapter Kit, possibly a small digital playback chip for "Auto CQ", and a small PWR/SWR meter. I may even convert that crankey Ramsey 20m 20 watt amp I have to 80m (just swap out the LPF) and add that, though I would not be able to use it for full break in or semi break in CW, just SSB. Anyway...

What effect does remote mounting VR1, VR2 and the tuning polyvaricon have on performance? I can see where there might be a problem with the polyvaricon being hooked up off the board and picking up stray RFI and/or having tuning effects on the VFO circuit. I would use high quality, well shielded small coax like RG-316 for the to-board connections for the polyvaricon, and all internal RF connections, maybe even audio as well. I don't see any problems at all with mounting the digital display several inches away. (Found some very nice colorful backlit 16 x 2 LCD displays as well)

Has anyone mounted these three controls offf of the board?

What was your experience and can you offer any tips?
tnx es 73, Ken AD6KA/5R8GQ

1781. Re: T1,T3 Which way up on circuit board?

Yahoo group: mkars80
Date: 2010-07-18 18:52:52 UTC
From: Ken
Topic: 1709 Message: 1781

Hello Richard:

Since the Primary and Secondary windings
are identical, you are correct, it does does not
matter which end goes which way on the PC board.
Do tin the wires before installing and double check
the continuity to make sure there isn't a short between
the primary and secondary. Quite unlikely, but.....just one
of those small details to check to avoid trouble later.
I try to make sure part of the tinned
wires extends a couple of mm above the top
side of the board, but that's just me.

Put all four wires through the holes, then pull
them gently snug on the solder side (pull
wires to the side about 45 degrees to hold them in place)
and then turn the board over again to check your work
on the component side(see if there is still some tin
showing on the top side).

I have found that a good pair of electronic grade
tweezers is great for this. I sometimes also pull
the wires snug again (after initial installation)
by heating and melting the joint while pulling lightly
on the transformer wire. (Do this gently so as not to break
the wire, been there, done that, it's no fun especially
if it breaks off too short to resolder,hihi) This step may be
seem a bit anal but that's the way I am about construction.
It's also a good technique to hold round toroid
inductors in place without using unsightly glue.

Be careful is using tis "melt the transformer wire solder
joint and tug them snug" technique when installing
the trifilar transformers (T4, T5,T6) as you are
"sugging up" a rectangular core with with tindings
on only one side. Tugging them too
tightly makes the core end up sitting on the board at a
an angle. Bad contruction practice and looks
ridiculous. (I know,I did it! Easy fix) After everything checked
electrically I just gently lifted those trifilar cores and slipped
in a piece of double sided "Scotch" tape carefully cut
to the size of the core.(Another handy use
for those good tweezers!)

Have fun, hope this helps.
Sorry for being so long winded!

1782. Modified MKARS80 on eBay

Yahoo group: mkars80
Date: 2010-07-25 19:33:05 UTC
From: Steve
Topic: 1782 Message: 1782

Just noticed a very nice MKARS80 on eBay, item 230503209165.

It's in a very nice case, has an s meter, backlit LCD and varicap tuning added.
Unfortunately it's not mine. Does anyone know the source of the case used?

Steve 2E0SGB

The info appears to be listed under the product decription
in the "Questions to Seller" section. You have to log into
Ebay to read the entire reply. I didn't bother.
If in fact it is not there, you can email the seller.
Via his call, 2w0jmk, e-mail addy listed at QRZ.

1789. Another MKARS80 comes to live in ZL

Yahoo group: mkars80
Date: 2010-08-04 09:26:24 UTC
From: shawchris82
Topic: 1789 Message: 1789

Just to let everyone know that my MKARS80 is now finished.

A big thank you to Steve for dealing so promptly when I ordered the kit in April and for his advice yesterday. I have learned a lot doing this especially:
don't build when tired
use a hot iron to ensure that the coil wire enamel burns off
print the circuit diagram large - 4 x A4 sheets
check the voltages against the manual sooner rather than later

Steve - the problem in tx was that Q9 was 0,0,0 volts in tx. I checked all the voltages as the 'scope shown not tx at all. This led me to T3 and a check (which I thought I had done) showed one side of the coil was not connected. A hot iron (40W) on both sides fixed it in seconds. Sure enough the modulation light then extinguished against my voice peaks.

First QSOs tonight - one in Christchurch and the other lower South Island. Good reports.

Thanks a lot

Chris ZL4CTS

1790. Still my favorite radio in the shack after a year

My MKARS80 is over a year old and still the best little radio you can buy. It never drifts and I always get great reports about my audio. I took it on holiday with me and made a tiny L match with resistive bridge SWR indication and 40 meters of thin wire. I threw the wire into a tree 4 meters high and made several QSO's the best being 1600 miles, not bad for 5 watts and a wire in a tree. At home on my 9 meter high dipole I have worked most of Australia. I love this radio, flawless.

1792. My L match tuner

Yahoo group: mkars80
Date: 2010-09-03 03:31:59 UTC
From: Charley
Topic: 1792 Message: 1792

Here's a quick description of my L-match tuner with LED SWR indication. I wanted a very small L-match tuner to go with my MKARS80 for portible operation, I settled on a Schematic by Stephen Yates AA5TB. I used only parts I found in my junk box so it cost me all of about $5. The enclosure I made from single sided board. The inductor came from Jaycar electronics, CAT# LO1234 Material L8(what ever that is) 25mm x 15mm x 10mm. The wire is .63mm magnet wire. I used 1/4 watt 100ohm resistors in parallel because thats all I had, and after many hours of use they haven't given me any problems. I just wound the toroid with a tap every 6 turns and soldered each tap the a pin on a rotary switch.

The little tuner works great and to use it I just whistle lightly into the the mic on the MKARS80 and tune until the LED goes out, I have checked it several times with an actual SWR meter and it always tunes to 1:1 SWR. The little tuner also work with my pixie 2 and I will be using it with my next rig, a SW+40.

I am uploading some pictures of the tuner to a folder called VK2ZYZ L-Match along with the schematic if your interested.

Hello Om,

A few days ago I have finisd to make my radio the mkars80kit but I don't receive any station...
I Have checked for wrong placed parts but find nothing wrong also checked for the value of the voltagetables pages 21 of the manual these are correct (only measured in rx mode)
The display is working fine also the vfo range in mine case is going from 3.450 to 3.9 mhz
With a frequencycounter on TP 10mhz measured
I only hear a low sound (noise) from the speaker
If I tip on point 3 of the LM386 then I hear a loud noise from the speaker

What is going wrong?

Hi Jan
I had a similar problem and it turned out to be bad solder joints on T6. Check the solder connections on T4, T5 & T6. They need plenty of heat to melt the varnish on the windings.

Hope this helps.

Regards

Dave G0BVV.

From: SA2AWO
Topic: 1793 Message: 1795

My problem is not the RX my problem is TX ...

but can tell this is my first build, has absolutely no customer munity on the subject. But bought MKRS80
to test my customer skills. Everything works except the TX ...
can anyone help me with my problem, it would be fun to try QRP

Sorry for my bad english

Hello SA2AWO [sorry you didn't give your name],
Have you got another receiver that can tune to 10 MHz?
If so you should be able to hear the SSB signal out of the
crystal filter. If you can't hear this then your fault is before
the filter, if you can then it's after the filter. Let us know your
findings and we can take it further.

Topic: 1799 Message: 1800

Hi Colin:
Thanks for your post. I have not built the specific amplifier
you mention, but it looks like a very nicely designed
project. I especially like it because it uses real RF transistors
instead of IRF-510 power MOSFETS used in the HF Packer
Amp (which runs them at a higher voltage for more power).
I have built the HF Packer Amp, but frankly
I think it is overpriced at about $250 USD. But maybe
you could buy the HF Packer amp modules separately???

HF Packer Group sells Low Pass Filter modules separately
as kits. The 50 watt module is the one used in the 35 watt
Packer amp, which uses a band switch directly wired to a
small PC board with all the coils & caps VERY close together.
But for only $5 more you can buy the 100w version,
which uses relays on a larger board instead:

http://www.hfprojectsyahoo.com/lowpassfilters.html

I have built that 100w LPF kit and use it with my
140w amp kit from CCI. It works very well.

Good luck with your project and for sharing
that old article with us. VERY nice looking
amp project

Hi,

You could check recent issues of QST from ARRL where 50 W amplifiers
has been described. You can also join the ARRLHBC yahoo group for more
information. Basically there are two designs, one low cost described
to be built "ugly" and another one with more features where the author
right now is designing a new PCB with SMD and he is now collecting
interest in kit or PCB purchases..

Hi.

I would agree that the 50w amp in the June issue of QST which can be built for around $28 looks very good although obiously the price will work out a little different in the UK.

To keep the cost down it uses a CPU cooling fan! It's built for any single band which would be ideal for the MKARS80. As Eric says it's built ugly style but it can produce about 50w with 5w drive.

Thanks for all the replies,

The QST article looks very nice, I had not come across that one.

I have also been sent a link to another design that has a single sided PCB with no SMT devices so is a little easier to build as I will have most parts available in my junk box :) Once built and tested I will let you all know how it goes.

It uses 2 x IRF510 devices and all fits on a single sided PCB 100mm x 70mm.

Regards
Colin G1IVG.

From: pete.flair
Topic: 1807 Message: 1807

Hello all,
my first post here, just purchased a MKARS80 with the CW add on kit.
I intend to build my kits into a Maplin vinyl style box, using a air variable for tuning, with a vernier reduction. So far, so good, but I also like to back-light the LCD, to you how have all ready done this,
which display do you use? What other mods have been done, and recommended, a simple L tuner for just 80m, guess that will fir into the box as well. Pleas give me hints, ideas and links. Will be much appreciated.

Hello Jogeir !
May be i double this messege, but let´s go for that.I can tell you
that i used a display with a very bright blue background which light
up very well i must say.The name of this circuit is ATM1602B and the cost for this in Sweden is about 100 Swedish crowns.I don`t know if you have the store "Kjell and Company" in Norway but i think you can find this circuit in many electronic-part stores in your country.

Hasse,
yes I can find many different LCDisplays from about Â£5 here in England.

Steve,
yes good advice for all to do it in that way, beginners, and experts alike.

I was hoping for more response coz, i can see that some of you did
build it in "not the original box". But I will figure out how to do it as the building goes on,
I am not a quick builder, like to take time to enjoy the project.

Like to here some response from those of you how have done the varicap mod,
Steve what do you think about using a varicap diode?

About my self, I am a Norwegian that partly live in the Philippines and partly
in London, now I am in London during the rainy season, so not have any workshop
here, but I have to do something hence this project.
Great value for the money, and good quality, compering to other kits
i have bought/build here in England.

1812. Rx works, but audio is low

Yahoo group: mkars80
Date: 2010-09-24 21:35:10 UTC
From: jrwdlw
Topic: 1812 Message: 1812

I finished construction of my MKARS80. It's working (I can hear stations), but the audio output is very low. The RF gain must be turned up to maximum to hear anything. I've tried both earphones and a speaker, with the same result. There is also a significant amount of hiss. So, my first attempt at trouble-shooting was to touch an un-connected test lead to various points in the circuit:

Touching pin 3 of the LM386 audio amp results in a 60hz like buzz, with loud scratchy noises.
Touching pin 2 of T5 causes a faint sharp pop, but no change in noise level.
Touching pin 6 of T5 causea a loud sharp pop, but no change in noise level.
Touching the junction of R57 and R58 does not change the noise level.
Touching the junction of D19 and D20 causes a huge increase in the noise level.
Touching the junction of D8 and C89 does not change the noise level.

Searching the user group, I saw someone suggest jumping the input to the output of the XTAL filter section. Using a jumper wire, I connected the junction of D19/20 to the junction of D8/C89. The "radio static" portion of the sound disappears, and there is only a soft, clear, hiss sound. I really didn't expect the sound level to drop. I then checked each XTAL to see that none are grounded. All pins have an infinite resistance to ground, except XTAL5 at D19, which measured 1.3 meg ohms. I would consider this to be ok.

My next step was to measure various transistors, and see if anything looks out of specification.

Here's what I found:

Emitter Base Collector
Expected Measured Expected Measured Expected Measured
Q3 0 0 0 0 0 0.01
Q6 0 0 0.65 0.64 0.65 0.65
Q7 0 0 0.39 0.44 2.20 1.98
Q8 0 0 0.57 0.55 2.20 2.05
Q11 3.6 3.8 3.6 3.64 7.5 7.46
Q12 3 3.34 3.65 3.94 7.5 7.46
Q13 4 3.53 4.65 4.15 9.4 8.48
Q16 3.9 4.31 4.1 4.39 7.2 7.12
Q18 4.2 4.383 4.3 4.431 7.2 7.12

I'm not sure how large of a variance is appropriate, but it looks like Q13 might be out of range.

I don't have a signal generator, frequency counter, or scope. What I have is "stone tools", and a DVM. So, can anyone suggest what I should try next?

Thanks,
John

John,
I think all the transistor voltages look OK, your problem sounds very
typical of a bad connection on one of the mixer transformers.

Its worth carefully re-soldering the transformer connections with a HOT iron
to make sure the enamel has been burnt off.

1814. Re: [mkars80] Rx works, but audio is low

Yahoo group: mkars80
Date: 2010-09-25 14:39:48 UTC
From: John Warner
Topic: 1812 Message: 1814

Steve,
I thought you were going to say that. I'm very new to understanding radio circuitry at the component level, so I want to confirm my assumptions. Looking at the schematic, T4 and T6 are VFO mixer transformers, and T5 is the BFO mixer transformer. Am I correct in assuming that I don't need to rework T1, T2, and T3, as they are some sort of output matching transformers?

I must say, that despite this minor issue, I'm having a lot of fun. I bought this kit to learn something at the circuitry level, so I'd say this problem is helping me reach my goal :)

John

From: Steve Drury
Topic: 1812 Message: 1815

John,

T1, 2 and 3 are in the TX path (does it TX?) so don't worry about these for receive. If the problem is with the mixer transformers you likely won't get any TX but if it does TX then the mixer transformers are probably OK.

From: John Warner
Topic: 1812 Message: 1816

Steve,

Thanks for the fast response. I don't have a microphone yet (and no watt meter or scope), so I can't check out the TX side. I'm going to remove, continuity test, and re-solder mixer transformers.

From: John Warner
Topic: 1812 Message: 1817

Steve,

Lot's of heat from a butane powered soldering iron, and the problem appears to be fixed. Thanks for the help, and thank you for a really nice radio kit. It's obvious that it took a huge amount of time and effort to bring this kit to market. I have just one complaint - where's my MKARS40 :)

1818. Re: [mkars80] Rx works, but audio is low

Yahoo group: mkars80
Date: 2010-09-28 14:12:24 UTC
From: Ken Pendarvis
Topic: 1812 Message: 1818

A cold joint at one of the mixer transformers
tripped me up too, but again luckily it
was an easy fix that Steve spotted right
away.
>I have just one complaint - where's my MKARS40 :)
That would be fun!
Just don't buy the Hendricks MMR-40. Ridicuously
overpriced and at best a medicore performer. I was lucky
enough to get one as a "board and parts only" kit before
Hendricks Kits FORCED you to buy everything for USD $225.
I guess it was a fun build, but a 3 inch long brass screw
held in place by nuts soldered to a PC baord and
surrounded by a coil (Permeability Tuner Oscillator)
makes for a a sloppy, drifty VFO. And what brain trust
decided that the CW/SSB switch should go on the bottom
of a PC board inside an enclsoure?

Glad you got your MKARS80 running well.
I love mine! 73, Ken AD6KA/5R8GQ

From: K.Greenough
Topic: 1812 Message: 1819

Hello John,
I had quite a time trying to find out why the audio level
on my MKRS80 was low and I followed a few false leads
until I discovered that the BFO injection level was low.
In my case I had made a poor solder joint on Q16.
I would check the BFO and T5. As you are hearing signals
it sound as if the filter is OK. [I played around with this
for ages, but it was a false trail hi]. You have a DVM, a
capacitor, say 1000pf, and a diode will make a RF probe.
The capacitor and the diode are wired in series. The free
end of the capacitor is your probe, the free end of the diode
goes to ground [PCB ground]. Your DVM is connected
across the diode. This will allow you to check that there is
RF on the emitter of Q18 and a higher level on the emitter of
Q16. You can also use this probe to check the VFO and
Buffer [Q13] . If your frequency display is OK then the VFO
must be working but this takes it's signal before Q13. Your
probe should show a higher level of RF on Q13 collector than
on it's base.
Hope this helps, 73 Ken g8beq
PS the diode needs to be a signal type, germanium or schottky
will give better sensitivity but a silicon type will work.

1821. Varactor Tuning Problem

Yahoo group: mkars80
Date: 2010-10-01 14:39:37 UTC
From: John Warner
Topic: 1812 Message: 1821

I'm trying to use the varactor tuning setup shown in the drawing posted by VE3XJ dated 23Aug08. It's the one using the MVAM109 and 2-pole 4-position switch. I'm using an NTE618, as that is what Mouser had in stock. It's working (the frequency changes), but the tuning range is very limited. Measuring the voltage off the precision pot wiper, it varies from .001 to 7.98v. However, the tuning range is only 4.150 MHz to 4.160 MHz. Adjusting C38 moves the tuning range around, but does not increase it. I have the cathode connected to C47, and the anode connected to ground, so it's not installed backwards. Any ideas on what I might have done wrong?

Thanks
John

Hello John,
My last mail, for some reason, took over a week to appear
so it's well out of date as I know you've solved your problem.

Topic: 1812 Message: 1822

Hi John
The following link to Lens pages relating to the BITX20 may be of help

http://golddredgervideo.com/bitx20/vfomod.pdf

Also an extract from a recent post from that Group

> .... there is a varicap made by Toshiba called the 1SV-149 that was used in portable AM radio service and designed to have a c1v to c8v capacitance range of 19pfd to 425pfd ! This is what I use in my Bitx20a with a single 10 turn precision pot. There is NO NEED for a fine tuning pot and I can cover 14.050Mhz to 14.350 Mhz with this one varicap. I use the spare hole for a Mic gain pot. I have the schematic and parts source if anyone is interested...
>
Thats the equivalent replacement of the MVAM108 and 109.......currently on ebay for about $14.00.

Hello John,
Removing C45, or reducing it's value from the present 100pF
will give a greater tuning range. Also you can use a LED as
a varicap diode, see Hans Summers site www.hanssummers.com
for lots of info on this.

Ken,

Thanks for the reply on this issue, as well as the low audio problem. That RF probe looks helpful. I'm going to have to put one together.

I don't understand why I'm having a problem with the varactor tuning mod. The circuit and instructions are simple and straightforward. Technically it's working, I just don't have any range. Here are the switch positions, pot setting, voltage readings, and frequencies:

1 High 7.98v 4.160.340 Mhz
1 Low 5.94v 4.159.200 Mhz
2 High 5.93v 4.159.225 Mhz
2 Low 3.93v 4.157.830 Mhz
3 High 3.96v 4.157.845 Mhz
3 Low 1.98v 4.156.065 Mhz
4 High 1.97v 4.156.065 Mhz
4 Low .001v 4.150.465 Mhz

As you can see, I get only about 10 Khz of tuning range. Since I need to order some other components, I might try again with a different varactor.

John

An interesting comment on the MMR-40 Ken.

I've been slowly collecting components for this for some time, my next build to be the MMR-40 as detailed here http://kd1jv.qrpradio.com/ARRLHBC/ARRL_MMR40.html . I wasn't over happy with the PTO, worrying it would slacken in use. Another issue was I sourced a no. 6 brass screw and nut here in the UK, but would have had to order the threaded hex nylon spacer from the USA, postage costing many many times its value. As time progressed I considered replacing the MMR-40's VFO. My question is, was its poor performance for you just related the PTO based VFO and the SSB/CW switch position? My other issue was I could never join the MMR-40 Yahoo group, it's either died or has been abandoned by its owner. Completely different from this great group that is always here when someone has problems. Apologies for being off topic re this non MKARS80 issue.

Ken,

Thank you for asking the question Ken, as it is not obvious to me. I don't really know much about component level radio circuits.

I measured from ground, to where the wiper of the precision pot connects to the junction of the 100nf capacitor and 1Meg resistor. I'm pretty sure I have it installed correctly, but would like to confirm it. Where should I measure, and what should I expect?

Thanks
John

Hi John

With a digital multimeter measure from cathode to anode on the varactor.

You should see similar voltages to those seen on the wiper of the pot.

Hello John,
As Peter says, measure across the diode, you need a high
impedance meter, usually 10M ohm as the diode is being
fed via a 1M ohm resistor. If the diode is the wrong way round
it will conduct and you will see about 0.6 volts across it [assuming
it's silicon] which will hardly vary at all when you adjust the pot.
If the voltage across the diode varies the same as that on the pot wiper
then the diode is correctly wired but if not producing any more than
the 10KHz swing you have then it's either faulty, or a VHF type with a
small capacitance change or the series cap' is faulty.

Hi Steve:
Sorry for the late reply to your question
>My question is, was its poor performance for you just related
>the PTO based VFO and the SSB/CW switch position?

No, not at all. Those were not the sole reasons.
In my experience the MMR-40 has a mediocre receiver.
I only hear strong stations, both on CW and SSB.
Receiver is nowhere near as sensitive as the MKARS80
or the BITX20A. The entire setup and tuning is awkward
and a hassle, not just the PTO screw and associated coils.
(Which I had to to adjust by changing number
of turns, padding with caps...by experimentation
with different values before I got the BFO in range.
I do not have a scope or signal generator (which they say
are "extremely helpful) but I do have a lot of QRP kit
construction experience. And it is it's an unpleasant chore
to solder three brass nuts to a PC board so they are *exactly*
in line. If they aren't, will "freeze up" at a certain point, usually
in the middle of the operating range.
In fairness, I built this Hendricks rig when it
first came out, and thy were offering 'board and parts only'
versions. Maybe they've made improvements and changes.
Hope this helps, 73, Ken Ad6KA/5R8GQ

Thanks Dean:

An external VFO might be just the ticket.
And maybe something I've overlooked is
causing the disapointing receive sensitvity.
When I get some extra time I will go over
my MMR40 more carefully. I bought it because
I liked the idea of both CW and SSB in monoband
QRP rig.

If there are any MMR-40 experts out there who
would like to give mine a going over I'd very
much appreciate it.

The best monoband 40m SSB QRP kit rig I've ever used
is the Small Wonder Labs White Mountain 40. But that
series was discontinued over a decade ago.

Apologies for hijacking the thread!!!

1835. Re: [mkars80] Varactor Tuning Problem

Yahoo group: mkars80
Date: 2010-10-10 03:31:57 UTC
From: John Warner
Topic: 1812 Message: 1835

Ken and Peter,

I didn't get to try your suggestions until last night. I checked the voltage across the varactor, and it varied from about .1v to .25v. Your comments prompted me to try reversing it in the circuit. I had the varactor, capacitor, and resistor soldered as a single assembly. I reversed the assembly, and measured again. The circuit was acting extremely strange, with the displayed frequency varying widely, from 4Mhz to 9.9Mhz. Frustrated, I gave up. Later that night, I realized that I had reversed the entire assembly, which meant the capacitor and resistor were connected incorrectly. So, this morning I tried everything again, with new parts. Same problem, the wiper voltage varies from 0v to 8v, but the varactor voltage from 1v to .25v. Next, I reversed the varactor. Everything worked perfectly.

Now, here's the really interesting part of the story. The manufacture's packaging, and data sheet, are incorrect in how they identify the anode and cathode of the varactor. The varactor (NTE618) comes individually packaged, with the specifications, and a picture identifying the anode and cathode printed on the plastic bag. The plastic bag is a little ambiguous, but the data sheet has a different view of the part, and it is perfectly clear regarding the correct orientation. According to the data sheet, I have the anode connected to C47, and the cathode (K) connected to ground, and yet it works.

Thanks so much for your help and suggestions, I doubt I would have ever tried reversing the part, unless you had described the symptoms. Especially since the data sheet, and VE3XJ schematic indicate that I had it installed correctly.

John

Hello John,
I'm pleased to hear that all is working OK now, strange
for the data sheet to show the connections wrongly but
these things do happen hi. I usually check transistors,
diodes etc before I put them into circuit, saves trouble
shooting when it's the part that's duff. I recently ordered
some driver transistors from Icom UK, I fitted them into
a set I was repairing and they worked OK, the owner of
the set collected it and then telephoned to say that he had
no output. The transistors had blown and yet on checking
the DC conditions there was nothing wrong [I suspect that
the transistors had a high Hfe and had taken off and destroyed
themselves], they were very expensive, just under ?100 for
the pair. I saw some advertised on Ebay, from Hong Kong, a
lot cheaper so I ordered some.When they arrived [and this is
the point of this narative] I checked them and found that the
lead outs were wrong, they were stamped up as Mitsubishi
but were obviously not. I got my money back but if I'd just fitted
the transistors I'd have put a short across the supply line with,
no doubt, a lot of damage. As an end to this story I found a
supplier in Ireland who had the transistors at a third of Icom's price,
I fitted these and the set has been OK for a few months now.
It pays to check hi. Good DX with your MKARS80, it's a very
nice transceiver and a fantastic bargain.

Ken,

Did you ever get any response to your questions?

I am looking at doing the same thing, except I would like to replace the var-cap in favor or varactor tuning.

I already have a case in mind the will have enough room for the MKARS80, CW adapter, battery, charger, etc.

I am looking for a replacement for the LCD, one that is back-lit.

From: Pete
Topic: 1838 Message: 1838

Moving to a new location and I do not have any space for a 80 antenna any more I am selling my MKARS80 and CW kit, as new.
Nothing build yet.
Selling it for £60.00 + p&p

Ken/Dean,

*** The huff 'n' puff circuit has a limited range, as well as a long time-constant. Quick changes in frequency, caused by vibration - or even the TX relay - will render the circuit incapable of holding lock with nearly any remote-mounting ***

Remote mounting the tuning cap will cause untold stability issues IME - don't do it - do the varicap tuning mod (under "files" in this group). If you extended it with coax, you'd find the tuning range restricted somewhat by the coax capacitance, but ANY movement at all of the coax would retune the radio!

If you used stiff wires, the TX will couple into it and it will take off - as well as being annoyingly unstable :-(

>> If you use a 10-turn pot with the varicap mod, you can dispense with the fine tune control if you use a large knob. I actually use the capacitor on-board with a 10:1 reduction drive and replaced the fine tune pot with a push-button for the backlight. <<

The RF gain pot can be removed from the PCB and mounted on a bracket at right-angles to it. Just keep the leads really short (<1 inch). The Fine Tune pot can be remotely-mounted with no issues, but keep the wiring away from the PA stage.

Backlit LCDs are readily available and can be mounted away from the PCB - but keep the wires away from the LPF & front end (and RF gain pot) or you can get noise. In fact, my backlit LCD couldn't be mounted on the PCB, as it would have displayed upside-down! I have short pieces of ribbon cable - about 2" long on mine, allowing me to mount it from the chassis.

Best of luck and don't forget to post photos of your mods!

1840. High current before adjust PA bias

Yahoo group: mkars80
Date: 2010-10-16 14:38:58 UTC
From: jrwdlw
Topic: 1840 Message: 1840

I'm trying to adjust the PA bias current. R2 is set to the minimum. LCD says 14.5v. Receive current is 128ma. Transmit current with no microphone (I grounded Relay1/D6) is 626ma. The LED lights, and there is quite an increase in the level of output from the speaker (clicking that I believe is caused by the LCD). If I have the microphone connected, there is loud feedback.

Any suggestions?

Thanks
John

John,

With R2 set to minimum I would expect the TX current to be around 280mA with 14.5V supply and no modulation. Have you adjusted the mixer ballance - R59 / C103 as per the instructions?

1842. Re: [mkars80] Re: Mounting Controls & Display Off PC Board

Yahoo group: mkars80
Date: 2010-10-16 15:27:52 UTC
From: Steve Drury
Topic: 1779 Message: 1842

Here is my input....

Fine tune
Should be no problem fitting control remotely, perhaps best to use screened lead though.

Polyvaricon
You will have to use screened lead which may affect the stability and the added capacitance might cause a problem. A Dutch amateur (sorry I can't remember who) simply rotated the Polyvaricon 90? to the PCB and mounted it on some brackets, the shaft was then extended to the front of the radio.

RF Gain
Use thin coax and you shouldn't have a problem

Display
Use ribbon cable, you may experience some noise but try it and see.

1843. CW adaptor mounted in MKARS80 box

Yahoo group: mkars80
Date: 2010-10-16 20:06:26 UTC
From: John
Topic: 1843 Message: 1843

Hello Folks,

At the recent Hamfest there was some interest in my MKARS80 CW adaptor on display that was mounted in a matching case to the MKARS80 itself.

Having had requests for details on this I have uploaded some pictures of including internal shots which may give a few ideas to those contemplating the same thing.

The MKARS80 sits nicely on the top of the CW adaptor looks reasonable and controls are nice and accessible. I removed the keyer speed pot and mounted it separately alongside the pots on the main PCB

Yahoo group: mkars80
Date: 2010-10-17 02:41:33 UTC
From: John Warner
Topic: 1840 Message: 1844

Steve,

I haven't tried setting the mixer balance, as I haven't got a low power watt meter or scope. I'm going to try the s-meter approach, but I haven't quite worked out the logistics.

What I did do, is re-solder T1 and T3. If you recall, I had some problems with the Rx side transformers. After re-soldering, I decided to measure the TX voltage on Q5 and Q9 (power supply = 14.1v):

Emitter Base Collector
Q5 TX 6.4 7.1 7.1
Q9 TX 2.6 3.7 11.1

As you can see, Q5 is way out of spec. Any suggestions?

Thanks,
John

John,

Is Q5 in the right way round?
If so then you have a short between Q5 emitter and base, internally, or on the board somewhere. Looks like where the extra 300mA or so are going.

My guess is Q5 either the wrong way round or a blob of solder collector / base, check with an ohm meter. Also check that the 22R emitter resistor has survived!

Steve G6ALU

PS Q5 does get hot in normal operation.

1847. Re: [mkars80] Re: High current before adjust PA bias

Yahoo group: mkars80
Date: 2010-10-17 20:22:14 UTC
From: John Warner
Topic: 1840 Message: 1847

Mike,

Q5 is mounted correctly. I don't think the emitter and base are shorted. Here's my assumption why (which may be completely wrong!). With the power off, I measured across R25 (470 ohm) and it reads 363 ohms. If there were a simple short through the emitter-base, R25 would be in parallel with R19 (22 ohms), and it would read about 21 ohms (470 * 22 / 492 = 21 ohms)

I don't know anything about the ZTX651, but it appears the collector-emitter are connected in an un-powered state. Why? The 363 ohm reading on R25 would be the expected value if R25 is in parallel with R22 (2k2 ohm) and R19 (22 ohm). My reading, and the calculation, 2222 * 470 / 2692 = 388 ohms, would tend to indicated that.

Here's what really confuses me. I measured across R22 (2k2 ohms), and it reads .8 ohm (that's right, less than 1 ohm). Assuming the collector-emitter connection, R22 is in parallel with R19 (22 ohm) and R25 (470 ohm). So, 2200 * 492 / 2692 = 402 ohms. Not even close to .8 ohm. This leads me to believe that there is a collector-base short, PCB short, or R22 is bad.

I'm going to try your suggestion of looking for shorts on the board, and then I might remove Q5. With it out of the circuit, it will be easier to see clearly if it's internally shorted.

I really appreciate the help Mike. And please point out any errors in my assumptions. I'm trying hard to learn from this.

Thanks,
John

From: John Warner
Topic: 1840 Message: 1848

Steve,

If you read my response to Mike (G8EEY), the resistance across R22 is less than 1 ohm. Based upon your comment, I assume the collector/base shorted. I'll check the board and resistor first, and then pull Q5 if required.

Thanks for the help.
John

My guess is Q5 either the wrong way round or a blob of solder collector / base, check with an ohm meter. Also check that the 22R emitter resistor has survived!

Steve G6ALU

PS Q5 does get hot in normal operation.

Hi John,

Yes, a senior moment on my part, I meant to say base-collector short on Q5, I don't know why I said emitter :-(

1850. Re: [mkars80] Re: High current before adjust PA bias

Yahoo group: mkars80
Date: 2010-10-17 22:39:39 UTC
From: John Warner
Topic: 1840 Message: 1850

Mike & Steve,

I removed R22 and Q5. R22 is ok, as it measured just slightly under 2k2. Q5 is interesting. The DVM indicates emitter-collector as infinite, emitter-base as 4.8 meg, and base-collector as infinite. Not what I was expecting for the base-collector. I have no idea what a good ZTX651 would measure. I'm wondering if I fried Q5 getting it out, transforming thr shorted condition into an open circuit? Don't know if that's possible, but all the evidence implies the base-collector was shorted while it was in the circuit. I've looked over the board carefully, and I don't see anything else that could have caused it.

Anyhow, the next step is to order a new ZTX651 from Mouser, and see if that fixes the problem

John

1852. Re: [mkars80] Re: High current before adjust PA bias

Yahoo group: mkars80
Date: 2010-10-18 13:07:42 UTC
From: John Warner
Topic: 1840 Message: 1852

Please DO NOT send a transistor. I get one from Mouser with my next order of "goodies".

I realized later, that I could have tested the transistor "like two diodes". I will try that this evening. Also, I like your idea. I may just solder the transistor and resistor back in, and see what happens!

Thanks,
John

1853. Re: Small linear for MKARS80 ?

Yahoo group: mkars80
Date: 2010-10-29 18:30:28 UTC
From: G1IVG
Topic: 1799 Message: 1853

All,

As promised here is an update on PA0RCL's 40w linear that I have just completed. It really compliments the MKARS80. You can leave it in circuit and powered off for QRP or turn it on for 40w.

I made up a PCB using the overlay on Ron's website. The only change I made to the PCB was to turn the VOX transistor 90deg's clockwise and re-route the corresponding tracks to accommodate the new placement of the transistor making the solder pads for the transistor slightly bigger. I then populated the PCB with components mainly from my junk box. I bought the FT50-43, F37-2 and BN43-202 ferrite cores from www.jab dog.com here in the UK. Winding the coils was straight forward and I finally boxed it up in an Eddystone Diecast box from Maplins to keep it cool.

With 4 to 5w from the MKARS80 I get a solid 40w out of the linear. The only component change I made was to use a 100uf capacitor rather than the original 47uf to give a slightly longer VOX on time.

Many thanks to Ron PA0RCL for this design and the correspondence during the build.

Has anyone else built the amp?

Here is the link aging for those interested.

From: Jes
Topic: 1854 Message: 1854

Forgive if,from this point on,I ask the most stupid questions,but I am only a joiner and hammers and nails are my tools of choice!
I have built the kit to the point of initial testing.With power,antenna and speaker connected I get correct readings between supply positive and ground and at R34 and VR2.There was no smoke,no bangs and no smell of frying components.There is a hiss from the speaker but nothing more.I have checked for dry joints and reheated suspect solder and I have checked components for correct polarity.What do I need to check next?
All suggestions will be greatly appreciated and followed up even if I have already tried it.Thanks...Jes 2e0tew

Jes,

Have you fitted the display and micro yet? If not go ahead and do so as the results will give additional clues to any problems, but check the 5v supply first as per manual.

Regards,
Steve G6ALU

1856. Small linear for MKARS80...

Yahoo group: mkars80
Date: 2010-10-30 13:21:15 UTC
From: a_strong@btopenworld.com
Topic: 1856 Message: 1856

I have been looking at this too as I am sure others are doing and whilst I have the expertise to make the PCB (it used to be part of my job) I no longer have the resources.

Might there be sufficient in the group to justify having a small batch of boards produced?

Steve's supplier does a superb job with the MKARS80 tcvr PCB.

I have been using free PCB design software http://www.designspark.com/pcb ,
it works well.

Does anyone fancy laying it out? The minimum practical quantity with my
suppier is 100 PCBs but for small quantites you can use sure electronics on
ebay.

I think Newbury Electronics will do 10 PCBs and up, usually with a quick turn around. But like everything else you pay for it.

We use them at work and they seem quite quick.

If you only have one row of blocks the micro isn't talking to the display.

The micro won't talk if it doesn't get a clock, this comes from the BFO. If you have a 'scope check for output from the BFO if not I suggest you check the voltages on Q7, 16 and 18.

Let us know the results.

Sorry Steve,no scope here,just a multimeter!

Q7`s readings are;
Emmitter - 0
Base - 0.39
Collector - 2.2

Q16`s readings are;
Emmitter - 0.25
Base - 0.83
Collector - 8.01

Q18`s readings are;
Emmitter - 8.01
Base - 1.43
Collector - 0.83

Not what they should be and display is now blank!

Jes,

What is the voltage on pin 9 of the micro within a few seconds of turn on?
If this is about 2.5V all is well, if it is 0V or 5V then the micro probably
isn't getting its clock.

The readings for Q18 are the wrong way round, I suspect you confused its pin
out?

Regards,

Steve

OK, it doesn't sound as though the BFO is running but all voltages look
sensible - can you examine the soldering very carefully in the area of Q18.

If you can't find anything amiss it may be quickest to post it back to me
for diagnosis, I will just charge you the return postage but will also be
able to set it up for you using test equipment.

1872. L1 to L5 Values

Yahoo group: mkars80
Date: 2010-11-09 21:56:34 UTC
From: m0icw
Topic: 1872 Message: 1872

Hi All,

Can anyone tell me the Henry values for L1 , 2 ,3 ,and 4 (L5 is noted in Construction Manual as 4.8uH).
When I checked my L5 (40T of 33 SWG ECW on T37-6 toroid), on my (Calibrated) LCR Meter, I got a reading of
2.8uH, a long way off the suggested 4.8 uH.
This got me wondering about values for L1 to L4 !!

Morning Fred,

Those are the values they calculate to using manufacturers data - what frequency does your LCR meter test at? To some extent the values were arrived at empirically so the circuit operation isn't affected but for interest I will measure a few samples on the network analyser - this won't be until next week though when I have access (I don't own one!).

The most important thing is the VFO tunes the band required and the LPF filters harmonics - and both meet those requirements.

Morning Steve,

Tks for the info on Inductor values in the MKARS80 circuit.

The LCR that I use, measures at 3 different frequencies, 200kHz, 15kHz
and 1kHz.
200khz is the test frequency used typically for an inductance range of
0uH to 0.3mH.

I will be very interested in the results that you obtain next week, on
the network analyser.

1875. Re: High current before adjust PA bias

Yahoo group: mkars80
Date: 2010-11-13 03:37:31 UTC
From: jrwdlw
Topic: 1840 Message: 1875

I thought I would update the group with my latest progress. I tested Q5, and it was ok. As Steve suggested, I reinstalled Q5 and R22. The TX current dropped from 626 ma to 343 ma. Since that was still higher than normal, I measured all transistor voltages during TX. I found that Q3 had 0 vdc on the base during transmit, while the opposite side of R5 had 14 vdc. Suspecting a short, I removed Q3, tested it (it was ok), and reinstalled it. After that, the base had .72 vdc on TX, and the TX current had dropped to .28 vdc. I guess that was another soldering issue.

After a short victory celebration, I set the PA bias current to .33 vdc. I hooked it up to a dummy load, and ran a wire from my mobile HF antenna to six inches from the dummy load. I had my wife key the mic and count, while I sat in the car checking the frequency and audio quality. The frequency was only 40 Hz off, and the audio sounded great! Unfortunately, I discovered another problem, but I'm going to start a new thread for that.

1876. Re: L1 to L5 Values

Yahoo group: mkars80
Date: 2010-11-16 08:50:32 UTC
From: hamlab3
Topic: 1872 Message: 1876

Fred,
I quickly tested one sample of T37-6 this morning, I didn't have 33 SWG wire to hand so wound it with 40 turns of 36 SWG (shouldn't have a significant effect).

On a calibrated LCR meter (an old Philips PM6303) it measured 5.3uH, the measuring frequency is only 1kHz.

Using the network analyser and displaying a Smith chart (S11), the value read 4.65 uH at 6MHz, this was stable across the range I checked (300kHz to 10MHz).

I'm not sure why your reading was so low, if you would like to return the toroid to me I can check it on my equipment.

Have you built the radio, and does the VFO adjust OK?

Regards,
Steve G6ALU

Steve,

Being unable to locate a replacement display for my MKARS80, could I buy another one from you?

Hi Dean,

Yes certainly, I will sell it at cost GBP 5.00 - please transfer GBP 5 to
our Paypal account and I will post it.

Regards,
Steve G6ALU

From: m0icw
Topic: 1872 Message: 1879

Hi steve,

Yes, I have now completed the radio and the VFO adjusts OK.
I have some 37-6 Toroids in my parts bins, so may try winding on one of those and testing. If it is nearer to the 'empirically' arrived at value suggested in the instructions, then I will swop out and return original to you for analasys. I wont do it right now as it seems not a problem with VFO adjustment, and anyway, as I have hot glued toroids in place, it's a 'if it ain't broke'... situation !
I will let you know my measurement results from my parts box toroids.
Tks for info Steve

Best regards,

Fred M0ICW

From: g6alu@tiscali.co.uk
Topic: 1872 Message: 1880

Fred,

I was very surprised the inductor measured so near the calculated value - previously they have measured higher.

If the VFO adjusts OK I'm not concerned.

1881. Connecting the coils / transformers

Yahoo group: mkars80
Date: 2010-11-25 16:18:35 UTC
From: manxmat
Topic: 1881 Message: 1881

I found these to be quite fiddly affairs to solder to the PCB, hope the following tip maybe useful.

One thing I found very helpful in connecting up the coils/transformers with the thinner diameter wire was to make a 'loop' from some of the spare thinner enamelled wire and twist the ends together and solder them - this allowed me to feed ends of the coils/transformers through the loop and push the twisted end through the PCB to draw the correct wire through the PCB.

Best regards

Matty

From: Ken Pendarvis
Topic: 1881 Message: 1882

That's a good method Matty:

What works well for me is to have a good
quality pair of electronics tweezorsors on hand.
Hold the transformer over the board in one
hand and use the tweezers to guide the thin
wires into the holes.

Another method is to use a small square of
3/32" double sides foam to secure the transformer
to the board. Then use the weezers to guide the
wires into the holes.

In high frequency circuits 15m-10m, above) this is an especially
good method, as keeping the transformer a bit above the board
prevents RF coupling to the board.

Topic: 1883 Message: 1883

Hello,

We are thinking about building the MKARS80 a project in our club. As I see in the manual for MKARS80, the building is not done module by module with testing in between. I think that is a good way to learn more about the trx. As anyone done it that way? If so, maybe you have some notes about this.

I was thinking something like this:

http://golddredgervideo.com/kc0wox/bitxver3new/newmanual.htm

Thanks in advance.

Topic: 1883 Message: 1885

Hello Eric,

From the lack of replies it doesn't look as though any one has done it this way.

When I designed the MKARS80 I had to make a decision the best way to build it; I decided on fitting all the components before doing any testing and generally this works well. I understand your reason for building it section by section and exploring each as you go.

If you want to modify the instructions to allow this I can let you have them in Open-office format so you have some where to start from.

One reason I arranged the build as I did was so similar parts could be kept separate in the bags to reduce the chance of build errors.

Regards,

Steve G6ALU

1887. Drilled cases

Yahoo group: mkars80
Date: 2011-01-03 14:09:24 UTC
From: Steve Drury
Topic: 1887 Message: 1887

Is there any one in the UK able to drill MKARS80 cases with reasonable accuracy for re-sale?

I have had several enquiries from those who would rather not or are unable to drill their own, it's not economical to purchase ready drilled cases from the manufacturer.

Thanks,
Steve G6ALU

Hello Pascal.

I'm sure Steve will come back to you about this but it has been a question which has been around since at least February 2009.

I think some people have tried with some success but as far as I am aware there is no official 40M version.

I'm sure you will have replies, sorry I cannot help.

All the very best,

John.

Topic: 1888 Message: 1890

Hi Pascal,

I had one working but it didn't have the dynamic range required without adding a volume control - I decided that too many changes were required to make it practical.

Regards,
Steve G6ALU

Hi Steve,

If the 40m version is impractical, just a thought - what about designing an add-on transvertor to use with the MKARS80?

Dean,
Correction on the URL - http://www.qrpkits.com/

I try and provide value for money, for the QRP kits radio a painted case costs you an extra ?57 + Paypal and shipping fees of ?19 extra.

The problem I had is on a decent antennae the radio completely overloads as it has no IF AGC, on 80M the MKARS80 cured this by moving the AF gain control to the front end and using it as an RF gain therefore keeping the system simple. The alternative is to add an RF gain control... having both RF and AF gain in my mind made the radio too complex but perhaps that's what people want? Perhaps my standards are too high and users will put up with overloading on large signals?

Are there any spectrum analyser plots for the TX output of the BITX20 variants? I don't have one to test but if any one wants to know how clean it is I'm willing to plot it for you - I'm interested myself!

I'm currently working on a non frequency specific design with AGC.....

And you succeed very well at prviding one of, if not THE best QRP
kits values in it's class on the market, Steve! Well done.
The MKARS80 is a TERRIFIC value
with or without all and any of the the options!

I was lucky to buy both a BITX20A and an MMR40 from qrpkits.com
as "Board & Parts Only" kits before they FORCED you to also buy the
fancy enclosure kit AND the Digital Dial. While I really, really like my BITX20A,
I am not so pleased with the MMR40. Mine is drifty as all get out, even after
warm up, and the PTO tuning leaves a lot of be desired. (So does locating
the SSB/CW switch on the bottom of the PC Board!)

1897. TX help

Yahoo group: mkars80
Date: 2011-02-05 21:29:17 UTC
From: Paul Wilton
Topic: 1897 Message: 1897

(Apologies if this gets posted twice - posting the message via the web didn't seem to work)

I have completed my MKARS80 but have a problem with TX. As a receiver, I can detect signals down to around -100dBm but I can't get any power out on TX (meter barely moves). I can hear the transmission on a separate receiver.

Using an iPod, I have injected a 440Hz sine wave of about 10mV into the mic jack. I can hear the tone in the headphones.

As I traced the circuit round with my 100MHz scope, I get a nice 10MHz sine into port 6 of T6. I also get a nice VFO signal into port 3 of T4.

I have checked continuity of T6 and T4 via junctions of D13/D14 and D15/D12 for T4 and D14/D15 an D13/D12 for T6.

There is a waveform coming out the mixer. However, it doesn't seem to be around 3.7MHz - it seems closer to the VFO frequency. I have taken a photo of the waveform seem at the junction of L9 and C80 and have put it in the photo's section under my call sign M1CNK.

Firstly does this waveform look reasonable? There seems to be a lot of signal at 6.3MHz. Time base is 100ns/div, voltage 0.2v/div.

Secondly, that is the last place I can see it. If I look at the other end of L9 then the signal is not there. I have checked out L9 - it is not an open circuit and there are no shorts to ground.

I am a bit stuck at the moment. My gut feel is that I have messed up one of the transformers (T4 or T6) but I can't quite see how.

Any help/suggestions gratefully received.

Hi Paul

Presuming you have the diodes in correctly, I think your problem lies with one or more of the connections to T4 or T6.

I would suggest you carefully remove all wires from the board and verify that each winding is correct and that the solder on each is making good contact with the magnet wire.

Having done that then return the transformers to the board and try again.

Paul,

I've been repairing an MKARS80 today so have been able to do comparisons with your scope trace - I've uploaded my plot into the same folder as yours; you will note they are quite different - appart from the fact you have a decent scope!

As mentioned before check all connections are soldered properly, if so there is little alternative to re-winding the transformers. Note that its not always possible to determine if they are correct by reading them in circuit.

Thanks a lot for the advice. I found the problem with a fresh pair of eyes - the ground end of T6 wasn't soldered properly.

That's correct but it must be a very clean (pure) sinewave or you will generate harmonics of the tone; stations with narrow filters won't know where to tune!

1905. RX not working...

Yahoo group: mkars80
Date: 2011-02-24 21:53:19 UTC
From: Pascal
Topic: 1905 Message: 1905

Hi, just finished to build the kit...and switch on this evening, but not signal received - All voltages are ok, BFO and VFO well adjusted, I can just hear a small signal if I put a generator at the antenna plug...I suspect an issue in the first mixer as I cannot find any 10Mhz signal at the output...I took care of T4 and T6 (very small wires for my eyes!!!), so I don't see where to look for...Any idea will be welcome, thanks

Hello Pascal,

The most likely cause is a poor soldered joint on the mixer transformers, try re-soldering them with a very hot iron to make sure the enamel burns off.

Regards,
Steve G6ALU

Hi,

I made a simple tone generator you can build in the MKARS.You can find it in the files section: simple CW adapter.pdf I have it in use for some time now, no problems or questions about harmonics so far.

Thanks for the info. I will see if I can find it. I have looked at the CW adapter for the MKARS80, but i find it too expensive and I have already a very good keyer with memory etc.

Topic: 1905 Message: 1909

Hi,
I doubled check T5 & T4 (easy to do when removing pin 2) and have rebuild carefully T6, but same issue - no signal going out of the quartz filter, so I suppose mixer is not working properly - injecting a sinus signal 3.7Mhz at antenna connector, the signal is horrible after the mixer (VFO signal is clear and same level as the input around 500mV)- I don't see any fault in the components or in the soldered connections...What else to check in order to understand what is faulty ???

Pascal,

I think you have a problem around the mixer, this is a double ballanced mixer so the input signal and the VFO should be much lower at the mixer output.

In the files section of this group there is a plot of the lower copper layer, compare this with the track around the mixer - it is easy to "blob" across two points and cause an issue.

Regards,
Steve G6ALU

From: Steve Drury
Topic: 1911 Message: 1913

Hi Ingvar,

The filter bandwidth should be about 2.7kHz, slope is sharp on the BFO side
and less sharp on the low (audio HF) side. Sorry I can't give you any
absolute figures but you should find the performance quite good.

From: Mart Seger
Topic: 1915 Message: 1915

Hello!

I have bought and built a Mkars80 kit and it worked right from the get go. I'm now building a cooler case and adding extra features to the Mkars80.

I would like to build a notch filter, as a matter a fact, i already built one, but it is very noisy and goes oscillating very easily, its this one:
http://www.zerobeat.net/g3ycc/notch1.gif

I also would like to add a proper AGC to my Mkars80, i have tried the PA0RCL and G8EEY mods with no success. :(

Hi,
Yes I did....
But now I can trace the input signal from the antenna plug to the low frequency amplifier, but it seems to disapear after C39 - a 1khz 200mV at input of C39 gives nothing after - I changed C39 with another capacitor, but no more signal...strange...Q6 voltages are right.

I just found the fault...., defect PCB under Q6...a very light short circuit between Base connection and Ground , on component side (not made with my welding as found on opposite side) - impossible to see without removing Q6 ... more than 10 hours to solve this fault. Hope no more issue when I will test the transmit function. 73 to all.

I'm glad you found it Pascal, was it copper or the solder layer - the PCBs are electrically tested during manufacture but I suspect its before the HASL (hot air solder leveled) is applied rather than after.

Sorry you had a problem,

Steve G6ALU

From: Steve Drury
Topic: 1905 Message: 1920

OK, sorry to say it must have been a fault in the PCB.

Please accept our appologies Pascal, to my knowledgethis is the first PCB
fault. I have had excelent serice from the manufacturer in the past.

Regards,
Steve G6ALU

1921. Re: RX not working...

Yahoo group: mkars80
Date: 2011-03-06 18:15:27 UTC
From: Pascal
Topic: 1905 Message: 1921

Hi Dave
Don't care a lot about that - this may happen - except this point the PCB is of good quality, easy to weld - the main thing is to find the fault - I lost too much time thinking about a mixer issue - I was too lucky with previous kits which works at first time ! - a suggestion about the kit documentation : a sheet with photos of what we must find on a scope at several location according to a given input signal would help to check the circuit. - TX is working , I have now to install the pcb inside the box - I will also add a speech processor and a VOX inside. I will also add a PTT switch on the box. If it works as I wish, I will try to use in my car as the small size and the front location of the control knobs make it convinient to use as mobile. I don't hope to work long distance, but listening and may be working local contacts would be enough. Thanks and 73 - Pascal

Always horrible finding these sorts of faults.
This brings to mind a re-phrasing of "Occams razor"
"Always look for the most simple explanation!"

That doesn't mean to say they are always the easiest faults to find.

C'est Bon Pascal

From: Steve Bell
Topic: 1923 Message: 1926

I've built a circuit utilising 2 transformers from Maplin and an opto isolator, details here http://www.m0kgk.co.uk/psk31.php.

I've not used my MKARS80 for digital modes, but there is one thing to beware of. The PA FET heatsinking and the free space inside is suitable for SSB or CW, but the on time is much longer with digital modes so it will warm up more. Phil posted on here some time back when using his MKARS80 for PSK31 that he had some frequency drift. Fitting a small fan inside the case cured the problem.

I ran my MKARS80 off a battery and made a direct connection, some transformers I've used in the past are Farnell part number 1130842 @ ?1.85.

I can not get the carrier down to zero (or close to) It is very strong when I listen in my main station. The SSB signal is terrible because of the strong carrier.
Have made a new T6, carefully soldered the wires. Did not help. What to do? Pse see picture marked SM7CFF from osc screen.

Hi,

Can you tell me what amplitude the waveform is - do you get any reading on your power meter with PTT pressed but no modulation?

There is very little that can cause an imbalance; D10, D11, C90, C103, R59, C21, C29. Does C103 and R59 have any effect and if so is R59 adjusted somewhere in the centre of its range? Remember it is a multiturn control, you will need to measure it to know when its near the centre.

Be careful trying to null the carrier using a receiver. Even with 60dB of suppression, you'll have millivolts of carrier - enough to peg your receiver meter over S9+20dB.

Use a power meter with a low power scale, or a CRO if you have one. Otherwise, try shorting the receiver input with a 3" loop of wire and try again. If the signal level is too high, just twist the loop into smaller and smaller areas until it works. I would set the loop so you get <S9 with a whistle, then it should be easy to adjust the carrier. The carrier should end up below S3 with 36-40dB carrier suppression.

Watch out though - many inexpensive receivers aren't well-enough shielded to do this and will just overload anyway. You can try taking the MKARS80 to the kitchen table for example, and monitoring from the shack. It takes 2 people and a lot of yelling though!

Best of luck =]

Thanks Steve,
I have added 2 pictures.
1/ No mod (Mike shortcircuited) 0,1 microSec/div, 50 mV/div
2/ Speaking a long word "Beeeee". 2 m(milli)Sec/div, 2 V/div
Do these values look OK to you?

Testing with a dummy load and listening to the signal on my main station, it does not sound so bad!
Maybe the carrier level is as low as it can get? I don't hear any carrier "on the air".

I could not see any movement of the needle om my MFJ 971 tuner when in transmit mode without modulation.

Hi,
I will measure and find the mid point of R59. C103 has a lot of effect on the carrier.
Reacts quickly.
Pse see pictures measured on the output using CRO

Thanks Jon,
I will try to get on the air asap.
Have built a tone generator to try CW. I prefer CW to SSB.

1937. VFO stabilisation

Yahoo group: mkars80
Date: 2011-03-15 20:41:19 UTC
From: Pascal
Topic: 1937 Message: 1937

Hi - During the first 15 mn , after a cold start, RX on, the Huff and Puff works well, but suddenly the frequency jumps down by 2khz. That may happen 2 or 3 times , then the Huff and Puff stabilisation becomes right. Has anyone seen the same thing ? Can I do some improvement ? 73 to all.

1938. PTT Delay

Yahoo group: mkars80
Date: 2011-03-19 16:02:24 UTC
From: g3sew
Topic: 1938 Message: 1938

After I press the PTT on the MKARS there seems to be a delay of one second or more before any RF appears at the output (even though the red LED comes on immediately). After that it works fine. And if I drop the PTT for a moment or two only, there is no delay when I come back on. But at the start of each over, I get the same delay.

Also if I supply a loud audio tone near the mike, and press the PTT, it takes a second or so before the red LED goes out.

Has anyone else noticed this, and can anyone see what might be causing it. There seems to be no issue with the PSU, and looking at the circuit, I can't see any RC combination that would give such a long charge/discharge time.

Hello Lee,

Good to hear you on this afternoon - it sounded very good.

I know you are using a Heil microphone, did you say this was amplified?
If so have you tried it with a simple electrect mike?

Let me know and we will go from there.

Steve,

Glad the audio sounded OK - and very pleased to work the MK-run station.

You got it in one - with the Electret there is no problem, but when I use a dynamic mic with preamp, I hit the problem, as the preamp is being powered by the elctret bias line, and has 100uF across the incoming supply. If I drop this to 10uF that should fix the problem.

Many thanks,

Lee

Lee ,

The microphone bias is supplied by R17 from the TX12V supply, in your situation it may be a good idea to lift the 12V end and take it to the 8V regulated supply.

Steve,

Good point. I will try that if my fix has unforseen consequences. At the moment I have used a 1uF across the mic preamp supply, and this has killed the delay completely.

I use a Maplin QT21X mic with ptt switch, and modified it as in the MKARS80 Yahoo Group files section. The only thing I've noted is the lead could do with being a little longer.

I'm not sure where you are, or what access you have to electronic supply stores, but here in the U.S. we have several outlets that sell electret cartridges, and they tend to be very inexpensive. I've made several electret microphones by just inserting an electret cartridge into an old dynamic microphone housing. The results have been excellent, and the process very easy. I did this very thing with my MKARS80, and it works great. I bought an old microphone at a hamfest for a couple of dollars, then inserted an electret cartridge which cost me another couple of dollars. All you have to add is a small resistor, approx 6K to 8K, and a 6V to 8V source, for bias on the microphone pin.

Good idea using a surplus mic housing. But I think that the MKARS circuit already provides bias for the electret (so you shouldn't need a separate supply). I have just connected an electret mic capsule directly to the mic input, and that seemed to work fine.

You can get them in the UK from Maplins (part no. FS43W), at just under £4.00. But if you look around you can often pick them up even more cheaply. Not long ago I bought a pack of 3 for £1.00 - but I don't remember where I got it :(

I use a low cost computer desk microphone purchased from a common
superstore (Tescos), you need to rewire the switch as normally they are
in series with the electret element, you need to wire it as a separate
push to talk.

From: Steve Drury
Topic: 1937 Message: 1953

Hi Pascal,

I advise to leave the radio powered for a while before transmitting to enable the VFO to stabilise - time depends on the temperature of you shack etc.

Look for the tell tale indication on the bottom right of the display, it indicates how much correction is being applied to the VFO frequency; if it gets to three bars then that's the time to re-tune.

Regards,
Steve G6ALU

Hi Colin,

There used to be one and it was very successful, it got a bit difficult
though as we kept being walked over by QRO stations.

The frequency we used was 3.690 MHz at 9:30AM local time on a Sunday
morning... perhaps we should give it another go?

1956. Loss of frequency lock

Date: 2011-03-22 09:51:52 UTC
From: g3sew
Topic: 1956 Message: 1956

Hi

My new MKARS has been working faultlessly for a week or so now, but has suddenly lost frequecy lock. It now mostly displays the 'U' sign when left quietly on the bench with nothing connected except the power supply. Occasioanlly it changes to a '+' indicating that it has locked, but then very quickly reverts to a 'U', without getting a series of '+++'. Looking at the frequency displayed, it only has to change by 5Hz for lock to be lost. I have tried rebooting, as it seems like a processor glitch, but to no avail. Has anyone else seen this, or does Steve have any good ideas?

PS - I like the idea of an MKARS net.

Lee G3SEW

Lee,

I have to own up to a small bug in the code where it doesn't lock at one precise frequency - can you advise at what frequency your problem occurs?

Steve

That is really bizarre. As I began to think about it, it seemed to me that it had to be a software problem, because the PIC obviously knew what frequency it was on, as it was displaying it correctly, so even if it wasn't applying the physical correction, it should have displayed the correct indication ('+' in place of 'U' etc).

The frequency was 3.775.

Before receiving your email I managed to have a QSO on 3.727 without any loss of lock, but I didn't know why it had started working.

I have just retuned it to 3.775, and it is completely out of lock again.

Very interesting. How did this happen in the code - was it something you had built in for testing purposes?

It would actually be very useful to use one of the unconnected PIC port bits to switch locking off temporarily for tuning purposes. We could then attach a push button to it. It migh even be handy to be able to force the lock to stay on using another button on a second line so that if we jog the chassis, it doesnt lose lock.

what i did was to fit the veracto tuning mod into mkars made one hell of a diffrence to tuning and as solid as a rock

Do you have a reference for that mod Mark?

Also - I bet if you tune to between 3.774 and 3.775 it will still fail to lock.

From: mark
Topic: 1956 Message: 1961

Hi if you look in the file section you will find a reference under G8EEY'S mods section. To be honest I cant remember if the two I did looked on at 3.775 after doing the mod but I do know they were a lot more stable and internal temp change did not bother them.

From: Steve Drury
Topic: 1956 Message: 1963

Yes that's the frequency - I need to look at the code but its likely due
to the carry bit and the way I'm using it.

1964. Re: Loss of frequency lock

Yahoo group: mkars80
Date: 2011-03-22 20:26:14 UTC
From: g3sew
Topic: 1956 Message: 1964

Interesting. It would be good to fix it, as I got thoroughly caught out on the air. I called a station on 3.775, and my frequency wandered about all over the place - to the point where the other station had some problems copying, and I had to quickly switch to another rig :-)

As I began to think about it, it seemed to me that it had to be a software problem, because the PIC obviously knew what frequency it was on, as it was displaying it correctly, so even if it wasn't applying the physical correction, it should have displayed the correct indication ('+' in place of 'U' etc).

It migh even be handy to be able to force the lock to stay on using another button on a second line so that if we jog the chassis, it doesnt lose lock.

1965. MKARS80 net on Sunday

Yahoo group: mkars80
Date: 2011-03-23 19:30:50 UTC
From: Steve Drury
Topic: 1965 Message: 1965

We are planning to hold an MKARS80 net this Sunday at 9:30 UK time (remember the clocks go forward!), frequency will be the QRP centre of activity 3.960MHz so lets hope we don't get walked over.

Regards,
Steve G6ALU

OK, before any one tells me the frequency should have been 3.690MHz,
that below is out of band!

Charles,

I will listen out for you.

If its noisy on 3.690 I will post a clear frequency here.

I copy G3SEW 55 with qsb, but other stns were too weak - using the Mkars80 and a 50W/70W amp, antenna is a vertical delta loop for 40m
- Thks for qso - 73 to all the group - F6EHP Pascal

1975. Re: [mkars80] Re: MKARS80 net on Sunday

Yahoo group: mkars80
Date: 2011-03-27 09:24:35 UTC
From: Steve Drury
Topic: 1965 Message: 1975

Hi Pascal, we heard you!

The tally for the net was as follows:

G3SEW - Lee - St Albans
M0MMI - Mick - St Albans
M1CXK - Allen - Dartfort
G3YLW - Phil - Kings Lynn
F6EHP - Pascal - St Pol deLeon, France
G3UD - Graham - Stoke on Trent

Thanks go to Lee for being "net controller", he was using an MKARS80
with additional power amp which helped out by moving the gate crashers!

We plan to have another go next week.

Regards,
Steve G6ALU

Good to hear everybody on the net this morning. Shame there is so much activity on adjacent channels!

Definitely worth another try next weekend.

From: Trygve Sjothun
Topic: 1965 Message: 1977

I got there a little late but there was so much noise on the band (on my end) that I didn't persist. The bottom line is that I need to get my antenna life sorted out. I'll dial in again next week hopefully.

Cheers,

Tryg

Hi enjoyed this mornings net .Had a high background noise running mkrs80 I finished a few months back into modest trap dipole what a great little rig Steve I would love a top band version .Steve peaked 5&6 with me at times but there was a lot of qsb on the signal .Lee was a good copy most the time . Sorry didnt hear much from the other stations Look forward to trying again Phil (g3ylw)

I will probably buy an Yaesu MH 84, which should work with a modified plug. I downloaded a diagram on the net.

I use a low cost computer desk microphone purchased from a common
superstore (Tescos), you need to rewire the switch as normally they are
in series with the electret element, you need to wire it as a separate
push to talk.

1980. Weird image on my MKARS

Yahoo group: mkars80
Date: 2011-03-27 16:50:31 UTC
From: g3sew
Topic: 1980 Message: 1980

Steve,

I mentioned that I had some kind of image on 3.727. I have listened more carefully, and it actually appears to zero-beat at 3.7265. Oddly there seems to be two commercial stations which appear on top of each other at this frequency - very strange. One of them is 'Sunshine Radio', which according to its website is on 1.452MHz. I can't work out how this can mix to give an output on the 10MHz IF. If I preceed the MKARS with a tuned preamp, it disappears. Also I don't get this effect with my ICOM switched to the same ant. But I seem to remember exactly the same thing happening with the Epiphyte. This is very odd, since it was also on 3.727 approx, and I think that it was the same broadcast station that I heard - and again a tuned preamp got rid of it. It is the more strange since the Epiphyte uses a 455KHz IF. I can also hear a stronger version of Sunshine Radio on 3.542 on the MKARS. There is also something on 3.665.

My MKARS is not in a box, but since the unwanted signal disappears when I unplug the antenna, or insert the tuned preamp, this probably isn't the cause?

Any ideas?

Lee G3SEW

Lee,

Its probably getting into the IF - try putting it into a (metal) box if only temporary to see if it cures the problem, remember there is no other screening on the MKARS80.

If you bring your fingers close to the crystal filter does it get worse?

Steve

Thanks Steve,

It didn't seem to get worse when touching near to the filter. But I like the idea of a screened box test. Will report back.

Hello Lee,
That sounds like intermodulation, two strong signals mix
[or harmonics of them] to produce the signal you hear.
The extra tuned circuits in your preamp reduce the signals
strength sufficiently so that they don't cause the intermod' .

Hello Ken,

Yes - I was trying to work out the numbers, but nothing seemed to make sense. And I am not particularly near to any broadcast antennas either. More research needed I think.

Does the level go up and down as you adjust the RF gain?

From: g3sew
Topic: 1980 Message: 1986

The level goes down when the RF gain is turned down, in the same way as a normal signal. There is no dramatic drop off as the gain is turned down, as sometimes happens when you have breakthrough.

I have now tried boxing the rig, and unfortunately, that doesn't make any difference.

My next step is to swap rigs with Mick M0MMI, so that I can try his MKARS on my antenna, and he can try mine on his antenna, and see if the problem is specific to my rig, or to my antenna, or both.

> >> I mentioned that I had some kind of image on 3.727. I have listened more carefully, and it actually appears to zero-beat at 3.7265. Oddly there seems to be two commercial stations which appear on top of each other at this frequency - very strange. One of them is 'Sunshine Radio', which according to its website is on 1.452MHz. I can't work out how this can mix to give an output on the 10MHz IF. If I preceed the MKARS with a tuned preamp, it disappears. Also I don't get this effect with my ICOM switched to the same ant. But I seem to remember exactly the same thing happening with the Epiphyte. This is very odd, since it was also on 3.727 approx, and I think that it was the same broadcast station that I heard - and again a tuned preamp got rid of it. It is the more strange since the Epiphyte uses a 455KHz IF. I can also hear a stronger version of Sunshine Radio on 3.542 on the MKARS. There is also something on 3.665.
> >>
> >> My MKARS is not in a box, but since the unwanted signal disappears when I unplug the antenna, or insert the tuned preamp, this probably isn't the cause?

Hello Lee,
The only Sunshine radio I can find record of on MW
Iis on 855 KHz.

Hello Lee,
Sorry if this is obvious, but on your first mails you said
you couldn't find any " mix" that gave the 10 MHz IF, but
of course if it's intermod' then a mix to the 80m
frequency could be what you're looking for. That said,
the fact that the signal does not disappear when you reduce
the RF gain would suggest that it's not intermod' so it's a puzzle hi.

Hi All

OK, I'll have a stab at this.

at 3.7265 MHz the VFO is about 6.2735 MHz

(0.855 MHz x 3) subtracted from (6.2735 x 2) = 9.982 MHz close enough to the pass band of the Xtal filer, given the bandwidth of the AM transmission.

0.855 MHz x 3 is occuring in the first RF amplifier due to the high signal strength driving the transistor into distortion.

6.2735 MHz x 2 is a product of the VFO oscillator.

How to get rid of it?

I would suggest a series LC circuit resonant at 0.855 MHz connected to the receive side of the change over relay, or move away from the MW transmitter.

Of course I could be way off as well.

Hello Peter,
That mixing process is certainly possible but when the
RF gain is turned down you'd expect the interference to
disappear. Lee also says he's heard it on another Rx
which I think has a different IF. I did wonder if signals
were being mixed elsewhere, ie the old rusty drainpipe
stories that used to abound at one time. But Lee says
that he doesn't hear it on his Icom transceiver.
I have paid particular notice to this as I have experienced
similar problems, I used to hear BBC R5 on top band and
so did another local amateur. It turned out to be the second
harmonic of the 909 KHz transmission from Moorside Edge
[about 40 miles away]. The other local worked for a big comm's
firm so when he reported it they listened to him and it disappeared.
I have a mast about half a mile from me which carries High Peak
radio on 106.4 MHz FM. Many FM RXs in my house hear this station
superimposed on all others, better quality RXs are clear. But I can
hear it, very distorted, at many spots on SW using older RXs, the local
osc' is multiplied up and beats with it. The FM signal is so strong I
can read it on a field strength meter and it's a nuisance when signal
tracing in equipment, counters read 106.4 and I read RF at all sorts
of strange places. It took me a few weeks after this station came on air
to realise what was happening. Anyway that's strayed somewhat from
Lee's problem, I would imagine Lee, that an ATU or BPF would cure your problem.

Peter and Ken - thanks very much for your replies. It looks as if the mixing is happening in the MKARS itself, and Peter's calculations look very good.

Mick M0MMI dropped his MKARS around just now, and his is completely clean. So we have narrowed it down to building errors (shocking!). Further tests seem to show that if I feed the antenna in at the change over relay (ie after the low pass filter) the problem disappears.

I have resoldered the joints in the low pass filter, but with no change. And resistance readings along the filter are also good.

Oddly, I find that I can almost null out the unwanted stations on both 3.7265 and also 3.542 by adjusting the RF gain control. When I take it to about one eighth of a turn from max gain, the unwanted signals drop right down. They come up a bit as I reduce the volume past that point (anticlockwise), then they reduce again as I continue to turn the gain anti-clockwise. But this may just be finding the optimum imput impedance for the high pass filter immediately before the first RF transistor.

When I try injecting the antenna signal at different points along the low pass filter, I find that injecting at the junction of L1 and L2 the unwanted signal is incredibly loud (much louder than at the antenna). Between L2 and L3 it is quieter than at the antenna socket, while at the right hand end of L3 it is barely perceptible.

Lee,

If the intermod is happening inside your radio I would go for the first mixer - did Mick's radio seem any more sensitive than yours?

Check the soldering on each of the mixer transformer wires, if no luck there try some more diodes - I can send you some if that helps.

Steve,

Mick's radio had the same sensitivity as mine.

Doesn't the fact that when I attached the antenna to the relay side of C52 (ie just before the RF gain control), and that there was no interference when I did this, that the fault probably lies between the changeover relay and the antenna socket (ie somewhere in the LPF)?

Lee,

Sorry I didn't read your last mail properly... relay contacts perhaps
although I would have thought operating the relay a few times would have
"cleaned" them.

How strong is the interfering signal - do you have a general coverage
receiver you can receive it with?

Its certainly an interesting one!

From: g3sew
Topic: 1980 Message: 1997

Steve,

If I connect the antenna at the RH end of the LPF I get no intermod - so I can't blame the relay. I really think that the fault must be between the ant socket and the RH end of the LPF - ie somewhere in the LPF itself.

I have just checked medium wave, and I don't hear Sunshine radio on 855KHz at all, but it is 60dB over S9 on 1.458MHz. Mick's MKARS just shows how good the image rejection is on the rig - if you don't screw up something in the build process :-)

In response to Ken, the ATU doesn't make any difference unfortunately (though since a tuned RF preamp does get rid of it, I don't think we can deduce anything from this).

The next plan is to short out sections of the LPF.

From: K.Greenough
Topic: 1980 Message: 1998

Hello Lee,
According to the "Radio listeners guide" Sunshine radio is
on 855 KHz, but there are a couple of stations "Sunrise radio"
on 1458 KHz. Mind you these stations change owners and
names about once a week hi.

Hello Ken,

Sorry. It was Sunrise Radio (not Sunshine). Just had to listen through 15 minutes of ads and eastern music to get the ident! This is more logical since they are 60 over 9 here on 1.458.

Lee, re the ATU it depends on what type it is, low pass "PI" - capacitor to ground each end or high pass "T", inductor to ground in the middle.

Unless
its a home made one then its likely to be a "T" type which is interesting as it should have at least reduced the level of signal input.

Did you use the same connector / adaptor to attach your antenna to your rig as to Mick's rig? If its in the LPF I can only think there is a problem with one of the capacitors.

Regards,

Steve G6ALU

From: g6alu@tiscali.co.uk
Topic: 1980 Message: 2001

A little bit of investigation shows that Sunrise radio is broadcast
from Brookmans Park with an ERP of 150kW, not suprising its strong!

See http://en.wikipedia.org/wiki/Brookmans_Park_transmitting_station

Despite looking through the list I can't work out the other signal
required, asuming its third order and the fact that Sunrise is
inteligable I make the possible "other" frequency:

3.727MHz - 1.458 = 2 x Unknown = 1.1345

or 3.727 + 1.458 = 2 x Unknown = 2.5925 or for fith order 1.296MHz

For the later I can find The World Service on 1.296MHz, very powerful
at 500kW from Orfordness but only transmitted at night and about 100kM
from you.

See http://frequencyfinder.org.uk/AM_153_1611.pdf

2002. Re: Weird image on my MKARS

Yahoo group: mkars80
Date: 2011-03-30 19:18:52 UTC
From: g3sew
Topic: 1980 Message: 2002

Steve,

The ATU is a commercial one, and I don't have the circuit.

Mick's MKARS was connected up exactly as mine here. I just swapped rigs. I have now found that if I bypass the LPF by connecting a wire between the ant socket and the far RH end of the LPF, the intermod is not there. So I am going to dismember the LPF.

Lee, it can't be the inductors, can it? Which leaves the capacitors...
do you want a new set?

2004. Re: Weird image on my MKARS

Yahoo group: mkars80
Date: 2011-03-31 15:17:37 UTC
From: g3sew
Topic: 1980 Message: 2004

Steve

I have rebuilt the LPF outside the rig using the same coils but different capacitors - and the problem is still there! So this was a red herring. The problem is presumably futher down the line. I still get this effect where I can null the unwanted signals by turning the RF gain control. This does not alter the pitch of the hetrodyne - so it seems unlikely to be a spurious oscillation (and I can't find any other indication of spurious oscillation). But it does seem odd that it should null in this way.

While outside the rig I tested the performance of the LPF and it looked good. I also tested the performance of the HPF just before Q19 (while in circuit). This also seemed fine - though the 3.5MHz response was a lower than that for 4MHz by a couple of dB.

So - I don't think I will be needing duplicates of the LPF capacitors thanks Steve (unfortunately).

I have now put the LPF back together on board, and the images are at least as bad (and they are improved slightly by the ATU - though this is pretty marginal).

You are right about the 3.725 unwanted - I think I have heard both stations that are causing the intermod (one of which is Sunrise). But I'm not sure what the other is, and the stronger birdie on 3.542 seems to be unaccompanied.

Best results so far have been to put a parallel tuned circuit in the lead which goes from the bottom end of C52 and the top of VR1. I can tune out Sunrise pretty well with this, without it having any impact on other signals.

But I would much rather find the fault!

Hello Lee,
Have you checked the voltages on Q19 ? , if the
transistor is biased wrong it could cause intermod' .
73 Ken g8beq

Thanks Ken

Good idea - but sadly it is just what is should be :-(

By the way - does anyone know what the diodes in series with the collectors of Q15, 19, 21 and 22 etc are for?

From: K.Greenough
Topic: 1980 Message: 2007

Hello Lee,
Re, the diodes. If you look at the circuit of say, the RX RF amp Q19, it's collector resistor is 220 ohms. When on Tx this resistor and C91 are still connected to the balanced mixer, D12-D15 and they would shunt most of the Tx signal to ground. D9 is in series with the collector and on Rx is conducting due to the colector current but on Tx it is not biased on and so isolates R68 and C91 from the Tx signal. The other diodes serve a similar purpose.

Ken,

Thanks for the explanation - though I would have thought that the result of using the diode in the example you mention (D9) would be that there was still a relatively low impedance path to ground for the negative going half of the TX signal on its way to Q20 via C97?

Hello Lee,
Steve could give a more definate answer but I think the
signal levels are too small to bias the diodes on
[approx' 700 mV needed].

Yes, from the DBM there is only around -16dBm or about 50mV RMS into a
50R load.

Thanks Steve and Ken

All understood now!

By the way, I have just managed to hear Sunrise Radio on Mick's MKARS on 3.542MHz on my antenna (but nothing heard on 3.726). It is weak, but definitely there.

So why is my spurious so much louder than Mick's?

2012. frequency drift

Yahoo group: mkars80
Date: 2011-04-03 08:55:11 UTC
From: Pascal
Topic: 2012 Message: 2012

Hi Steve,
The frequency moves suddenly when transmiting for less than one minute - This morning, I switch on the Mkars half an hour before the net, it looks stabalized in receiving, and I could adjust with the fine Tune to reduce the "-" , but during my last transmission with Lee G3SEW, I suddenly moved down 3 kc and lost the contact (same as last week). What can I do ? Thanks - (doing fine tune during transmitting is not easy)

Pascal,

When you transmit, does the power supply voltage remain stable? If not, that could be the problem.

Good to hear everyone on this morning by the way. And thanks to Colin for the report from Bonn!

Hi Lee
Yes voltage is stable, between 13.5 and 13.6 V - Frequency seems to stabilize after on hour, which is a long time...
The net hour is late in the morning, propagation between UK and Brittany is going down at this time. See you next week - 73

Perhaps a more suitable time for the MKARS net would be in the evening when propagation may be better?

Pascal,

Is this a new fault, or has it always been like this? And does it properly stabilise on receive? With mine, as soon as I have turned on the power it will stay exactly on frequecy for hours on end.

Duncan/Pascal,

I wonder if it is worth trying 6pm (17.00GMT) on Sundays. Propagation should be better, but the band will probably be more noisy?

Lee,

This fault is from the beginning - I suppose the drift of the VFO is too high to allow the varicap to correct it a long time, so the system switch off the right frequency suddenly. I would probably have to change a few components around the tuning capacitor , but which ones ? and by which others ? I don't know.

About the net hour, yes evening should be better - we can try on day in the week, before to register a new schedule.
Can we try on Wednesday, but at 18 GMT, as before, I am at the office ?

Hi Pascal

Had about the same problem with my mkars 80,
It suddenly snapped out of lock.
I cured the behaviour on my kit by replacing R40 with a 8k2 resistor, that way C50 is "filled" a little faster by the "huff n puff" (i think).

Anyway, it helped on my kit, and its an easy thing to try.

Topic: 2012 Message: 2020

Pascal,

Does the display normally show a "+" without any bars or does it always
show bars as well, for instance " --+ " or " +-- " ?

The easiest thing would be to make you a small pack of all the
capacitors in the VFO but first please confirm that the VFO coil L5 is
quite tightly wound and is it fixed to the PCB in some way?

Regards,
Steve G6ALU

Pascal,

> First, make sure that you have good solder joints around the VFO area.
> Make sure that the VFO toroid is wound tightly with no loose turns.
> Secure the VFO toroid with a little dob of silicone sealant under it to stop it moving.
> Make sure that the variable is solid and cannot move.
> Ensure that the tuning shaft for the variable isn't fouling on the case - a little bit of friction here can cause strange shifts in frequency, even the relay vibration can cause 'creep'.

<< I assume that you have everything mounted solidly in the case. >>

My MK' had a bad drift to it when I built a small linear into it, but that was simply due to an increase in temperature caused by the heatsink plate that was close to the VFO. I removed the linear anyway as it was drawing too much power for my 7ah battery!

If you leave it switched on (but not transmitting), how is the drift over time? In my experience, I always let it drift for a few minutes before trying to tune, but after 3-5 minutes, it stays locked.

I have had some issues when using it in cold (<10C) weather when portable, but it usually settles after a couple of retunes.

>> If the sudden drift is still apparent after 5 minutes on receive, I'd suspect the variable capacitor. If you wobble the shaft lightly (not turn), does the + & - indicator go crazy? My 40m QRP DSB TRX suffered from this - the only solution was a new cap =[

Keep us posted =]

Pascal,

Happy to try 17.00GMT Wednesday evening on 3.69 - OK?

But will your VFO be stable enough to have a QSO?

I would have thought that it was more likely that the Huff & Puff stabilisation was not working properly. Steve's question about the "---" signs in the display should help to clarify that. Does the "U" in the display ever change to a "+" ?

Hello Lee,
I notice from several of your mails on your interference problem that you have concentrated on the low pass filter, but of course a low pass filter is not going to help remove medium wave signals. You need either a band pass filter or a high pass [cut off say, 2 MHz] in front of the existing filter to form a band pass or a notch filter tuned to the medium wave station. It's worth noting that with a decent length aerial many medium wave stations can produce Volts of signal.There is a single stage HPF in front of the RF amp', Have you checked L8 ? You could try a lower value inductance, obviously too low will attenuate the 80m signal but the medium wave signal should fall off far more rapidly.

I don't know about 80m conditions at others QTH's,
but in the morning at my location most signals on the band are incredibly
quiet, many right down in the noise.
In late afternoon and evening the propagation gets much better
despite any noise.
I reckon it wouldn't be a bad thing to give it a go and see what happens.
I would suggest an hour later, 7.00pm (18.00 GMT)?

Duncan G4DFV

Duncan/Pascal,

I wonder if it is worth trying 6pm (17.00GMT) on Sundays. Propagation should be better, but the band will probably be more noisy?

Ken,

I was suspicious of the LPF because it seemed that if I introduced the antenna after the LPF, the problem was reduced. I was not thinking that the LPF should have removed the LF stations, but that there might be some non-linearity there, with possibility for intermod. But this was all a red herring, as when I recreated the LPF outside the rig, I got the same symptoms. I have now checked the frequency response of both the LPF and the HPF, and they are both as they should be.

I am now tracing a signal from a sig gen from the ant socket through the receive side of the rig, and this seems to show major anomalies.

I will post again when I have done a few more measurements.

2027. Surprising it works at all

Yahoo group: mkars80
Date: 2011-04-05 18:59:27 UTC
From: g3sew
Topic: 2027 Message: 2027

Hi,

I am still trying to track down why I get images and intermod on my MKARS. Tracing a signal through from the antenna socket, my MKARS has massive amounts of VFO signal in the main signal path. Q19 has 400mV p-p on its collector at the VFO frequency. This comes from T4 (when I remove C81 it stops). On pin 2 and 6 of T4 I have 500mV p-p (on Mick's this shows no VFO signal at all). The other pins of T4 are similar to Mick's, but pins 3 and 5 have around 2V p-p with some distortion, whereas Mick's has 1.5V p-p clean.

Continuity on T4 looks OK.

I am surprised that my MKARS works at all, particularly as the TX seems to be giving a clean output.

Any suggestions gratefully received,

Lee G3SEW

Lee, when you say the waveform has some distortion, is it basically unsymetrical from positive to negative half cycles?
If so it might be worth checking the mixer diodes, I had these sort of symptoms, together with a fairly deaf rx, turned out to be a mixer diode that thought it was a 430 ohm resistor. Had to replace all 4 diodes in the mixer to get a decent vfo signal null.

Yes I would go for the same although I've no idea how we ended up with duff diodes! If that doesn't cure it rewind the mixer transformers, if you want to be sure all parts are OK I will willingly send diodes and ferrites.

Before you do any of that though its worth downloading the PCB plot from the files section of the group and check there are no unintended connections around the mixer transformer - try this link http://uk.groups.yahoo.com/group/mkars80/files/MKARS 80.pdf .

Hi
I am ok for 18 GMT, 19 local french hour tomorrow, Wednesday
Hope to hear you tomorrow around 3690
Pascal

I see that this item did not sell and is now re advertised at, what I would consider, a more reasonable starting price.

It can be found here
<http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=170623564317>

From: g3sew
Topic: 2027 Message: 2032

Steve,

There appear to be no bridges on the PCB - and Yes - I would very much appreciate a new set of diodes and ferrites. Thank you very much.

In answer to Mike, the non linearity appears to be caused by Q13 having too great a voltage swing in its collector. I get 2V p-p at that point, whereas on Mick's it is 1.5V p-p. My waveform at that point has a smaller swing from zero to negative than from zero to positive, and that is repeated when I take readings on T4 - though pin 1 of T4 shows the distorted part at the top rather than the bottom, due, I imagine, to the inversion caused by the inductor.

Lee,

That is exactly the effect you get if there is a duff diode in the bridge, change all four diodes first- it's the easier than rewinding T4, the mixer balance depends on how well the diodes are matched so four from the same batch is best. Make sure they are all in the right way HI.

2034. Re: Surprising it works at all

Yahoo group: mkars80
Date: 2011-04-06 15:35:54 UTC
From: g3sew
Topic: 2027 Message: 2034

Unfortunately it looks as if the diodes are OK.

I have taken out T4 and T6, and they all look fine, with no shorts, and each pair of leads registering around 48uH.

With T4 and T6 out of circuit, I also checked the 4 mixer diodes, and these all read correctly in both directions, and are all in the right way around.

Putting T4 and T6 back in, I still have the images, and the 400mV of VFO on the collector of Q19. This VFO signal also appears at the base of Q20 at 500mV p-p on both TX and RX.

Looking at the circuit, I cannot see what else could give a misbalance in the mixer and cause the VFO to appear at pin 2 of T4!

Now very puzzled.

From: g3sew
Topic: 2027 Message: 2037

Fixed it at last!

It turned out to be a broken track in the mixer between L6 and one of the diodes. All the diodes remained connected, so they passed the tests, and T4 and T6 passed their tests.

Anyway - it is great to have it working to full spec with no images at all - no more Sunrise Radio :-) so, many thanks to everyone who helped with suggestions, and apologies for clogging up the list with my woes!

Lee G3SEW

Lee,

Congratulations on finding it, I'm glad its working OK now.

I have to ask this.... was it our problem or yours? The PCBs should be
bare board tested but....

Regards,
Steve G6ALU

2039. Re: Surprising it works at all - Fixed!

Yahoo group: mkars80
Date: 2011-04-07 19:52:31 UTC
From: g3sew
Topic: 2027 Message: 2039

Bound to be my problem Steve. I applied quite a bit of heat to the transformer pads when the rig failed originally. This burned off the enamel on the offending lead, but the heat must have gone through to the other side and somehow lifted off one of the pads. I am absolutely certain that the board was not at fault - just the user :-)

Anyway thanks very much for all the help.

Will you be on for the Sunday net? Pascal has suggested there might be better propagation later in the day, so I will give it a try at 9.30AM BST, and give it another go at 19.00 BST. Can you run an amp Steve - I think we need a bit more grunt?

Lee G3SEW

My waveform at that point has a smaller swing from zero to negative than from zero to positive, and that is repeated when I take readings on T4 - though pin 1 of T4 shows the distorted part at the top rather than the bottom, due, I imagine, to the inversion caused by the inductor.

Tracing a signal through from the antenna socket, my MKARS has massive amounts of VFO signal in the main signal path. Q19 has 400mV p-p on its collector at the VFO frequency. This comes from T4 (when I remove C81 it stops). On pin 2 and 6 of T4 I have 500mV p-p (on Mick's this shows no VFO signal at all). The other pins of T4 are similar to Mick's, but pins 3 and 5 have around 2V p-p with some distortion, whereas Mick's has 1.5V p-p clean.

From: Pascal
Topic: 2012 Message: 2040

Hi, about the drift, I found C45 & C47 must be NPO, and the cap I have on my kit are not - they looks like standart ceramic cap,...so my next job is to find the right parts and to exchange them,..

From: Steve Drury
Topic: 2012 Message: 2041

Pascal,

If you fitted the parts in order as given by the manual then they will
be NP0 capacitors - there are two in bag one.

You can tell them apart from "ordinary" 1nF as the ordinary ones will be
round in shape, none of the NP0 types I supplied are round.

Let me know if you need new ones.

Regards,
Steve G6ALU

Steve, I did not confuse, as these C45 & C47 are 68 and 100 pf , not 1nf,but don't worry, I will receive new parts on next week from my supplier.
I will be pleased to hear you on the net this week-end.

From: Steve Drury
Topic: 2012 Message: 2043

Sorry Pascal... too much on my mind and getting confused!

C45 and C47 were at one time small blue capacitors - these were sold as NP0 and we didn't have any problems with them, latterly I had to substitute from other manufacturers but again they were purchased as NP0 but certainly haven't had as much testing as the originals. NP0 disc ceramics generally have a black band on the top indicating NP0 dielectric.

I think I'm back to the original type now if you need any.

A method I have used to check individual component temperature sensitivity is to get a small pipe - like you get on a can of freezer, WD40 etc - and gently blow through it directing the draught directly at the component in question. Components with poor stability soon become obvious.

Probably the least stable part in theVFO is C38 but this is the best trimmer I could find for the job - the purist might set it then remove measure it and replace with NP0 type capacitors.

Regards,
Steve G6ALU

2044. Re: [mkars80] Re: frequency drift

Yahoo group: mkars80
Date: 2011-04-09 00:32:30 UTC
From: Ken Pendarvis
Topic: 2012 Message: 2044

Excuse me if I have this wrong....but could polystyrene
caps be used in place of the small critical value NPO caps in
LC tuned circuits? I have seen these used in other
QRP LO's and such.

FWIW, after a few minues, my MKARS doesn't
drift appreciably.

There is a mod to stabilze the VFO in the BITX20A by
using Polystyrent caps, but it doesn't use the "Huff & Puff"
design. Just a thought.

From my distant memory cells.....
NPO caps = negative temp coefficient, whereas polystyrene have a positive temp coefficient.
In the past I have used a combination selected experimentally to achieve better stability.
I look forward to see how the huff and puff circuit works.

2046. Re: frequency drift

Yahoo group: mkars80
Date: 2011-04-09 05:43:05 UTC
From: g3oth
Topic: 2012 Message: 2046

Hi Paul,

The TC of NP0 ceramic capacitors is essentially zero.
The N (Negative) and P (Positive) both refer to 0 (Zero) TC

C0G (EIA) or NP0 (industry spec) is the material with the lowest capacitance/temperature dependence (Negative-Positive zero). C0G/NP0 dielectrics have the lowest losses, and are used in filters, as timing elements, and oscillators.

NP0 refers to the shape of the capacitor's temperature coefficient graph (how capacitance changes with temperature). NP0 means that the graph is flat and the device is not affected by temperature changes.

For more info about Classes of Ceramics and how to decode the various type nomenclature used visit:

http://en.wikipedia.org/wiki/Ceramic_capacitor

It should all make sense to you then.

I looked at polystyrene types for the 1nF feedback capacitors - we tried both ceramic and polystyrene in several radios; both have different temperature coefficients and even within the same type of capacitor they behave slightly differently.

Some VFO were more stable with polystyrene whilst others were more stable with NP0 ceramic, I guess in some cases the polystyrene capacitors were cancelling out a temperature coefficient in the other direction.

2051. Assembly error

Yahoo group: mkars80
Date: 2011-04-11 19:38:22 UTC
From: g3sew
Topic: 2051 Message: 2051

Steve,

I have tried a couple of times to assemble the source code for the MKARS in MPLAB, and keep getting the same build errors.

The first error flagged is:
Error[150] C:\USERS\LEE\DOCUMENTS\HOME_NEW\RADIO\MKARS 80\MKARS SOURCE CODE\MKARS SOURCE CODE - COPY\MKARS80-V2_4.ASM 130 : Labels must be defined in a code or data section when making an object file

Any ideas?

Lee

Topic: 2051 Message: 2052

Lee,

No I don't recognise that error - have you modified my source code?

Try this:

1. Make a new folder
2. Download the zip file and unzip in to the new folder
3. Double click on "HuffNPuff.mcp"
4. MPLAB should now start up with some warnings about files in
different places.
5. Go to "Project... Build All", it will ask if you want the code
compiled as "Absolute" or "relocatable"; click absolute.
6. It should now assemble and you are done.

Let me know at what stage it falls over.

2054. xtal selection?

Yahoo group: mkars80
Date: 2011-04-14 01:01:23 UTC
From: vk4apn
Topic: 2054 Message: 2054

I measured the parameters of the 5 xtals (using my minivna & xtal jig) and ALL parameters were very close, I have the following spread of freqs:-58hz, -40hz, 0 (centre freq), +39hz, +42hz.

I was going to put the highest freq in the bfo ? Any benefits in the order of the others?

Paul

Hi Paul,

I thought I replied earlier but nothings appeared yet!

I would use the -58Hz crystal as the BFO as its furthest from the
norm... it will easily adjust to 10.000MHz.

Hi Mac.

I'm sure Steve will have a suggestion buts here's mine for what it's worth.

I must admit that I didn't have any problems, or not that I remember because it was a couple of years or so since I built mine.

My suggestion would be to use something like a wooden cocktail stick or toothpick to act as a cushion to keep the wire away from the sharp edge of the hole at the opposite end to where the wire is emerging if you see what I mean. Also keep it in line with the hole so that contact with the edge is minimal as it is fed through. Perhaps a second person may be able to help?

I realise that this advice is obvious but it's all I can think of.

I wish you all the very best and I can assure you it will be worth the trouble, it's a very nice kit. One last thing, consider a slow motion drive for the tuning, it makes quite a difference.

Hi Mac:

When I am winding binocular cores, and they
seem to have sharp "edges" on the holes, I first use some very fine grain
emory paper to smooth the edges. (As not to scrape off the insulation).
You can do this quite quickly and easily by wrapping a narrow
length of the emory paper around the end of a pencil point or
tapered ball point pen. Then press the pencil/pen in the hole
and gently turn it and work down that "edge".

Also make certain that you are using the correct diameter wire.

I had the same trouble - the enamel on the supplied is quite "soft" and is easily solderable - that is the trade off. I ended up using some ECW from my own supply. It was made by the scientific wire company and the enamel was tough and had to be scaped off with an exacto knife before I could tin it! If that wasn't successful I was going to use some thin teflon tube I have over the wire.

Mac,

If none of the other suggestions work for you then its OK to use the 27 SWG wire - this has been done before.

There is a "knack" to winding 22 SWG wire - I preform the first turn and then "guide" the bending of the following turns to try and avoid damage to the enamel.

2061. Mounting IRF510 (Q1) Remotely

Yahoo group: mkars80
Date: 2011-05-01 14:40:47 UTC
From: jrwdlw
Topic: 2061 Message: 2061

What kind of problems might occur if I were to mount the IRF510 remotely from the PCB? Due to the type of case I would like to use, I would need to mount it about 2 inches (50mm) away from the PCB. Will I have problems with stray capacitance, rf, or other issues?

Thanks
John

Hi John,

I wouldn't recommend it as the added inductance of the leads are likely
to cause problems, my guess is low gain and possible instability.

Can you make up a simple aluminium (or copper) bracket to attach between
transistor and case? The transistor doesn't dissipate much power so thin
material would suffice.

Hi Rune,

It will probably survive, I'm guessing 15 - 20W is easily possible but
there are other considerations; the LPF isn't suited to high power, both
the ferrites and capacitors will need changing for higher rated parts.

John,

If you extend the leads, it will become rather unstable. You will also get RF feedback as well! Even long leads can do this - let alone extended ones. This is because the rig is unshielded and only gets away with it due to the low power and earthed PA mounting area.

If you look at the photos of my MK' (in the photos section under VK2JDP), you'll see that I used an L-bracket of 3mm aluminium. This works fine, as long as it is well-grounded. If you loosen the mounting bolts to the bracket, you get a CW transmitter :-(

Regards,

Jon Point
VK2JDP

From: G4DFV
Topic: 2063 Message: 2066

Is it really worth it?
Everything considered, increasing the MKARS80 output from 5 Watts to 20 Watts will only give you 1 'S' point increase in signal.

2067. Mixer configuration : Curiousity?

Yahoo group: mkars80
Date: 2011-05-04 08:11:39 UTC
From: Tony
Topic: 2067 Message: 2067

Hi,
I've noticed that the configuration of balanced mixers can vary between some of the reference sources.

Sometimes the VFO goes into the centre tap that connects to the diode bridge and sometimes it goes into the remaining winding that isn't centre tapped (as in the MKARS80.

Anyone got an explanation for this?

2068. Reducing band coverage?

Yahoo group: mkars80
Date: 2011-05-04 14:14:06 UTC
From: zaktherabbit
Topic: 2068 Message: 2068

Hi,

My MKARS80 tunes aprox 3.48 - 3.9. I'd liek to narrow this down, since on a band thats only 300kHz wide, an extra 100kHz coverage is some 1/4 of the dial! However, i have the trimmer on the polyvaricon fully meshed as it is.

I tried adding a bit extra capacitance across the tuning cap (tried 22pF and 33pF, but still couldnt seem to reduce the range. I realise now that i was increasing the range but decreasing the overall frequency!

Has anyone done any mods to reduce the range at all? Im guessing that im going to have to take a turn or two of the coil?

Regards

Martin

Martin

I used a 47pF dipped silver mica across the Polycon. Mine tunes from 3.81MHz to 3.58MHz as I'm not using it down the CW end.

Hi Martin, try the above experiment again as what you said does not hold water. Adding capacity as you described will indeed decrease the upper frequency as well as to a lesser extent decrease the lower frequency, BUT the overall range will NOT increase. You will find you will effectively end up with a reduced range that is not centred on the band. If you cant arrive at ideally what you want by adding parallel or series capacitors you will indeed need to reduce the value of L a little tocompensate but you will still have to adjust capacitors in tandem accordingly,
Jim Tonne W4ENE has produced a very nice free program specifically for the BITX VFO which you can use to model and experiment with such changes, I would recommend you download and experiment with it with values in a virtual sense before you start pulling your MKARS80 VFO apart. Then after you have discovered and become accustomed as to what is going on, tweak your MKARS80 to perfection. A google search should find you the program I mentioned.

Please read page 12 of the manual first to see if this will suitably
reduce the tuning range.

Steve - i followed p.12 to start with, i couldnt get the coverage lower.

Charles - your right of course. I'll redo the test, the added capacitance should indeed have lowered the coverage. I didnt take detailed measurements as i normally would, so could well be mistaken

From: manxmat@hotmail.com
Topic: 2047 Message: 2073

Hi Glyn

I have tried contacting ML&S last year to ask if we can purchase a new PCB (antenna connectors etc) for the IOMARS unit - I initially had a resposne & was told it would be a few weeks before they could give us a price as it had to be sent from the States.

After sending numerous emails, I gave up, I have also had zero emails from directly emailing MFJ themselves.

- Good luck with finding someone !!!!

In the meantime - I built one of these for my own use - I can't fault it at all, great piece of kit and excellent value for money!!

some info here:-
http://www.spirat.com.au/vk5zvs/pic11.htm

can order the kit here:-
http://www.scarc.org.au/index.php?option=com_content&view=article&id=47&Itemid=27

Took a few hours over a couple of evenings to build the unit, I had issues with 'oscillator kaput' message on the LCD and eventually traced my problem to the centre (common) pin on the rotary switch had not actually been connected to anything !!!

This kit does up to 30mhz, however in the first link, the author of this site has added another inductor and changed a couple of component values which give 6m coverage as well.

There is also another firmware mod which allows you to hook up to a serial port on a PC and run some software to create XLS type spreadsheet files so you can sweep the antenna and create graphs of SWR/Z Freq etc - all in all a great little bit of kit!!

Date: 2011-06-02 21:58:41 UTC
From: wizzbit_99
Topic: 2076 Message: 2076

Hi.
Is it possible to buy spares please?

I need 1 x Polyvaicon
2 x m 2.5 screws
+ the 2 nuts

I did try a polyvaricon off eBay but the screws didn't seem to be correct for it thus I damaged it.

So I'm in need of the 'original'

If so please let me know how.

Cheers

Mark

Evening Mark,

Was the Polyvaricon damaged whilst building the MKARS80 or do you need
one for another project? The screws I supply are 2.5mm but the
Polyvaricon threads are 2.6mm, they are a little loose but seem to hold OK.

Good Evening Steve....

Yes it was damaged whilst building the kit. Just for the record though it was totally my fault, whilst screwing in the screws I missed the hole and it bent the leads putting excess force on the spindle. Which damaged the vein.

The reason why I want the screws also is basically to start of fresh. So then I KNOW the screws are the correct ones.

From: Steve Bell
Topic: 2077 Message: 2083

I dithered for ages looking for the ideal case for a modified MKARS80 with no success, and ended up completing as a standard build in the supplied case. I'm thinking of building another including various mods, but in a custom case made from PCB material. These links give a good idea what's achievable and how.

http://k7qo.net/pcb_construction.html

http://k7qo.net/enclosure_tutorial.html

I've seen previous posts giving advice or warnings regarding long lead lengths.

Hi,

Do you have access to a frequency counter? If so adjust the BFO for
10.000MHz - most oscilloscopes don't have sufficient accuracy to set to
10.000MHz.

If you don't have access to a frequency counter make a small adjustment
to the BFO, check the frequency display using a known accurate source
and repeat until the display reads correctly.

Let us know how you get on.

2087. Mixer transformers - Securing?

Yahoo group: mkars80
Date: 2011-06-11 20:21:51 UTC
From: mikewogden
Topic: 2087 Message: 2087

Has anyone any tips on how to physically secure the three mixer transformers?

They seem very delicate and loose when held only by their windings.

Your comments please.

Mike - g4KXQ

I wouldn't use hot glue until you make certain that
the rig is working FB and all is well.

Actually, I don't use hot glue at all, just the wires themselves.
After the transformers are seated and soldered,
I reheat the joint and use a pair of hemostats (locking ttweezers) to
pull all the wires wire snug. I've used this method in all my QRP rigs and never
had a problem.

I use a small amount of silicon glue - the stuff scrap-bookers use.
Don't use bathroom sealer as that's corrosive.

I have also seen double sided sticky tape used.

2091. Just to say hello

Yahoo group: mkars80
Date: 2011-06-13 11:57:54 UTC
From: Philip
Topic: 2091 Message: 2091

Hi folks, new "old kid" on the block...
Been licenced for a good while G4JVF.
Lost interest in ham radio as most folk started using comercial rigs and being an avid tinkerer and builder, found less and less to talk about.

Anyhoo, finding the SDR Softrock kits re fired my interest and I've built quite a few now.

Had seen this MKARS80 on the various websites and luckily for me, I bumped into one at yesterdays radio rally at Alfreton M1 Junc 28.
Tried to resist but you know how it is :)

Anyhoo, what a great kit....
Got all the components fitted yesterday afternoon/evening and I've left the coils for todays task as I didn't want to place them earlier and risk damaging them...

Really excited to get this thing up and running.
No "proper" 80M aerial as yet but I do have a tuned loop so I can at least get started..

Congrats to the folk who designed and packed this quality kit (not sure who's who yet) and thanks for all the info posted on this Yahoo group....

Right, of to wind some coils..

Regards
Philip G4JVF

Hello Philip,

Welcome to the group, I am sure you will love the MKARS80 its a fantastic little home brew rig. I have had mine for a number of years and its used regularly.

Philip,

When soldering the coils into the PCB make sure you either use a very hot soldering iron or scrape the enamel from the wires before fitting - poor joints on the mixer transformers are the most common reason for the radio not working at turn on.

Best of luck,

Steve G6ALU

Ah could this be the reason I’m not getting any audio at the initial testing stage as detailed on page 11. I say not getting anything, I’m getting a very low level of background hiss that is barely audible but nothing else.

All voltages are as required. This is the first rig I have ever built.

2097. WooooHoooo! the receiver works...

Yahoo group: mkars80
Date: 2011-06-13 20:35:26 UTC
From: Philip
Topic: 2097 Message: 2097

Got the coils wound and fitted today, drilled the case as well...
Anyhoo, can't test the TX because I'm waiting for some bigger resistors to make a better dummy load.

Ive left out the PA transistor for now but the receiver popped into life first try so I'm pleased I didn't make any mistakes so far.
Display is nice and makes it a pleasure to set up the VFO.
The "huff and puff" is doing it's thing...
Set the BFO to 10MHz on my homebrew frequency counter.
Not a terribly accurate bit of kit that counter but near enough to get up and running.

Well, just enjoying listening to some SSB and CW on 80, rig seems stable and sensitive so a very happy bunny :)

Fits in the case nicely so I must be getting better at drilling holes in the right places..

Need to find a slow motion drive for the VFO if such things can be found these days.

More later when I can fire up the TX...

Regards
Philip G4JVF

Slow motion drive can be found here:

http://cgi.ebay.co.uk/6020-2-6M6-10-1-Ball-Drive-item-581-/290446043189?pt=UK_ConsumerElectronics_SpecialistRadioEquipment_SM&hash=item439feee835

This will directly couple requiring just two small screws into the top
panel which can be hidden by a large knob.

Topic: 2097 Message: 2099

Wonderful...
Many thanks Steve, just ordered one :)

Been sat out in the back yard with the receiver running on my homebrew tuned 80M loop...
The two were made for each other, some really good signals picked up.

Listening to 80 watching the sun go down....can't be bad..

Put three pictures in my photo album on here (G4JVF)
Must get the file out and fine tweak the rectangular hole..
Batteries look to be needing a charge as well..

Seriously good fun

Regards

Yahoo group: mkars80
Date: 2011-06-14 07:32:15 UTC
From: John Martin
Topic: 2091 Message: 2100

Hi Steve,

Yes as the voltages were as they should be I went ahead and set up the display which works fine and aligned ok. I was waiting to see a mate that has a frequency counter I can borrow for a few minutes to set up the BFO, however as it is now likely the transformers may have a problem I had better go back and concentrate on them rather than going any further.

It’s going to be a week or so before I can do any more now anyway.

Regards,

John

Bit more done today whilst I'm waiting for my dummy load resistors to turn up.
Printed a card front panel with a few personalised bits.
Cut a perspex front to cover the card...
Pictures in album

Fiddly but fun :)

From: tasmod
Topic: 2102 Message: 2102

Hi all,
Bought a s/h part completed kit at Alfreton.

Intend to continue the build and add the varicap tuning mod along with a standard type layout.

Will check in later when time pressure eases.

Rob G4NQX & G8VLQ

Good luck with it Rob...

I got mine on sunday at Alfreton as well...
Busy car park :)

Regards
Philip G4JVF

From: Philip
Topic: 2097 Message: 2104

The slow motion drive that Steve linked me to turned up today.
Very fast posting which is good..

Fitted it straight onto the poly's metal shaft and held it's collar to the case with two mini self tappers.
Cut of about 5mm of the shaft and cut out a shape in the perspex cover to accomodate the collar.
The tuning knob hides everything nicely..

Needed to make a tool to tighten the two allen grub screws so I snapped off the long end of an "L" shaped allen key and araldited it into a bit of brush shaft so I could reach into the space between the front and the printed board.
This reached nicely and I must say, the difference is amazing.
Nice solid feel to the tuning knob and I can now resolve SSB stations without using the fine tune...

Will be doing a 10 turn pot mod at some point but that's in the future.
My dummy load resistors turned up today so next job is making that up so I can fire up the TX...

Photos in my album (G4JVF)

2105. First audio

Yahoo group: mkars80
Date: 2011-06-16 07:48:36 UTC
From: tasmod
Topic: 2105 Message: 2105

Finished the final board details of the kit and then tried to fire it up.

Minor problem for a few head scratching minutes, I had not fitted the output sockets and the DC standalone ground pin isn't connected until the socket is fitted. No ground , no power !!

Once that sorted a few moments peaking a few things and audio present as well as a couple of signals on a short length of wire as antenna.
Pleased with that :-) Just the display to fit and test.

Next I'm looking at making up the pa0rcl varactor board tuning mod. I have the BB112 diode, choke and ten turn pot.

Looking forward to getting it in a better finish. The case is somewhat of a headache, the good ones cost as much as the kit!!

Rob G4NQX

2106. Case etc.

For those interested in a different approach to casing the kit, try a search for PA0RCL 's website. His designs and ideas are very good.

Another few things done today..
Fitted a small speaker on the back panel.
Fitted a 12V 40mm fan with a switch which with a 220 ohm resistor
in series, spins nicely without a high speed whine.

Drilled two vent holes either end at the top, one near the PA transistor
so I get a decent airflow for the fan.
Mesh is the stuff Halfords sell for car body repairs and it's araldited in.

Next job is a handle which will swing back as a support so I can operate
the rig with it at an angle rather than layed down or stood up.

Then, on to firing up the transmitter....:)

Regards
Philip G4JVF

2108. Bit of help needed with TX setup please

Yahoo group: mkars80
Date: 2011-06-16 18:16:12 UTC
From: Philip
Topic: 2108 Message: 2108

OK...
Decided to fire up the TX for a setup this afternoon..

Plugged in a 50 ohm dummy load with a simple diode RF probe built on.
Using a shorted jack (no mic) to act as PTT.
Standing current on TX was 230mA and I adjusted it to 280mA
using R2.

Connected the RF probe output to my digital voltmeter and got a reading
420mV....
Next I tweaked R59 to minimum dip and tweaked C103 to dip even more.
Moved back and forth from one to the other..

Problem is, at the lowest carrier reading I'm still getting a reading of 366mV not zero.
It seems that both R59 and C103 are at the end of their travel as far
as I can see..

Plugged in a mic and I can whistle it up to about 14 volts on the meter
so I'm getting four or more watts out into the dummy load.

Question is, what is the most likely thing wrong preventing me nulling
the carrier completely?
Not skilled in things SSB as I've never used it before so any help
would be gratefully accepted guys...

PSU is at 12.5V stabilised with plenty of capacity.

Regards
Philip G4JVF

Topic: 2108 Message: 2109

Had another go at this and I may be chasing red herrings using the
thrown together RF probe on the dummy load...

Turned the 25 turn pot to mid way then tweaked C103 then back to the pot.
Got the reading down to about 60mV so that's an improvement.

Anyhoo, put the meter to one side and fired up my SDR receiver on
80 meters...
Still with the MKARS into the dummy load, I could only just make
out a tiny trace of carrier on the SDR and that's with both machines
stood on the same bench..
Plugged in the mic and the audio sounded good through the SDR and the
waterfall trace showed a clean tight signal..
So, I may be OK after all...
What I did find was that adjusting C103 was tricky when using a metal
trimmer tool..I think C103 is in the right way round...

Mod LED is working as expected so I'll try on air at some point to
get a report.

Don't know if it's normal but the driver transistor Q5 gets quite hot
in my machine but then I have had it running for longish periods
whilst messing with the balance issue..

Regards
Philip G4JVF

Philip,

Sounds as though everything is OK to me - the driver transistor does get
hot, if you calculate it's dissipation you will find that its near to
the data sheet maximum, not had one fail yet though.....

Make that first call!

2111. Help with winding torroids

Yahoo group: mkars80
Date: 2011-06-21 11:07:31 UTC
From: jackthewhistler
Topic: 2111 Message: 2111

I have just started winding the torroids , and i am not shure when using the two holed ferrits...
Is one turn just pushing the wires through one hole, one time,
or is one turn pushing it through one hole and down through the other hole ?

Thank you in advance for your help.

2112. Re: Help with winding torroids

Hi.

I think you will find the answer on page 7 of the latest instructions.

Quote "Thread the soldered end through one of the holes of a BN43 ☐ 2402 core (the smallest core, see photo) leaving about 10cm remaining then thread the wire back through the other hole ☐ this is one complete turn. Loop the soldered end through a further 4 times to make a total of 5 turns."

This applies to the single winding transformers too of course.

The normal convention for binocular cores is that pushing the wire through one hole and back through the other is one turn..

ok. that means i have to wind it ten times through a hole of the binocular ones to get 5 turns total , right ?
"Loop the soldered end a further 4 times to make a total of 5 turns."
in this case the further 4 times mean 8 times through one hole - right ?

sorry for the asking, but i have never done that before, and sometimes i am a bit unsecure if i understodd things right, becausee english is not my first language...

Hi.
No. If you start by holding it like a pair of binoculars (easiest way to describe it I think) and push the wire through the left hole, or set of wires if that's the one you are doing, and then pull it back through the right one so that the start & finish are on the same side then that is 1 turn. Do the same again by putting it though the left & back through the right and that's 2 turns. Carry on until you have a total of 5 times through each hole which will give you 5 turns. For T1 & T3 do the same from the other side and so the amount of wires through each hole will be 10. Bear in mind if you start to get confused that the two ends of the wire on the same side are the same wire and of course the same for the other winding.
In other words on page 7 A & A' are one wire and B & B' are the other.

I hope that helps.

73,
John.

> Hi.
> No. If you start by holding it like a pair of binoculars (easiest way to describe it I think) and push the wire through the left hole, or set of wires if that's the one you are doing, and then pull it back through the right one so that the start & finish are on the same side then that is 1 turn. Do the same again by putting it though the left & back through the right and that's 2 turns. Carry on until you have a total of 5 times through each hole which will give you 5 turns. For T1 & T3 do the same from the other side and so the amount of wires through each hole will be 10. Bear in mind if you start to get confused that the two ends of the wire on the same side are the same wire and of course the same for the other winding.

2120. 60m version?

Yahoo group: mkars80
Date: 2011-06-22 06:22:10 UTC
From: zaktherabbit
Topic: 2120 Message: 2120

Has anyone attempted to convert an MKARS-80 to operate as a 60m radio?

Im applying for my NoV, but have no portable equipment. Perhaps a 5MHz version would be good for this

Hi Martin,

Don't forget on 5MHz you can only transmit on specific
frequencies...

That is of course true, but then the onus is on the operator to set the frequency correctly, as it is with any VFO/synth controlled radio. Perhaps the use of the polyvaricon might make setting that frequency a touch fiddly on occasion, but the radio itself should be workable? Of course, ive not looked into such issues as image rejection etc for the current IF against use on 60m

Martin,
To tune 5MHz the oscillator will have to run around 5MHz when using a 10MHz IF - obvious problem here is that the osc. frequency would be close to the IF which may not cause a problem but the second harmonic would pass straight through the BPF so will be transmitted.

Without calculating inter-modulation products an 8MHz IF would seem appropriate with a 3MHz VFO, image would then be at 11MHz which should be adequately attenuated by the LPF.

From: Ken Pendarvis
Topic: 2125 Message: 2125

I have the COMPLETE MKARS CW Adapter kit
with keyer, knobs, etc for sale. I am located in the US. (CA)
If any US hams would like to buy it without the hassle
of Pay paL and Customs forms, and having it arrive sooner,
please contact me at my QRZ email and make offer.

Sorry to jack the thread, my apologies.
My usergroup username and password have been lost and the yahoo
retrieval system for that info is not working.

2127. Help needed with display problem.

Yahoo group: mkars80
Date: 2011-07-01 11:03:41 UTC
From: tasmod
Topic: 2127 Message: 2127

OK the kit is completed and works OK on receive so far. However the display doesn't.

The display shows two lines of blocks when contrast is turned up but apparently no data.

I have tried three different pics and three displays. (A friend is building one.)

Scoping the pic inputs shows vfo and 10mhz signals.

The data lines show data, bar one, which doesn't. The voltage checks as per the build list shows pin 10 on the pic as .49v not 4.9v

The lines thru from chip socket to the display have been checked for continuity and clear OK.

I'm now at a loss where to look now.

I can't program another chip as my pic programmer has decided not to work as well !!

Any suggestions gratefully received.

2128. RE: [mkars80] Re: Help with winding torroids

Yahoo group: mkars80
Date: 2011-07-01 11:21:12 UTC
From: John Martin
Topic: 2111 Message: 2128

I cannot get any audio although the initial voltage checks are as spec and since fitting the display anyway I have set it up ok but still no audio obviously.

From something that was mentioned in previous emails it seems that one of the torrid could be at fault but I am not sure which one to start with, I don't really want to wind them all again??

Could someone point to the possible culprit.

Thanks.

John.

I am assuming that you have wound contrast pot thru full range?

> Scoping the pic inputs shows vfo and 10mhz signals.

The only issue I have had it the past (with PICs) that presented symptoms like yours is when I did not tie the "enable" pin on the display either high or low - cant remember which way.

If the PIC has 10mhz on the Osc pin, then apart from the enable pin, the only thing left is the PIC - if all else checks out OK

Good Luck

When you say no audio - do you mean:

You cannot hear any signals with an antenna connected (or sig gen etc)

or

The audio stage itself has no output? i.e. with your ear to the speaker do you hear a faint hissing? If you touch your finger to the lm386 input can you hear a change?

Really need more concise description to help further.

Paul,

Yes I swung the pot thru its range and am able to dim the blocks. I only said this to illustrate that two lines were available on the display.
I assumed this was because the enable line was activated, else I thought it defaulted to one line.

My friend and I are really stumped. He's more knowledgeable than I and he can't see the problem.

I did have various problems with torn tracks around the pcb display pads due to stupidly drilling the holes out from the 'topside' this unfortunately pushed the pads out of the board in circuit side. However we made small links up and all double check OK for continuity.

I drilled it to fit header pins. Wish I hadn't.

2132. First Qso and some mods

Yahoo group: mkars80
Date: 2011-07-01 12:21:16 UTC
From: Philip
Topic: 2132 Message: 2132

Pleased to have got my first QSO with the little rig last night...
I spent most of yesterday squeezing in an 80 meter dipole which took some time. It's not very high up but it got me out nicely and using the dipole has made the receive noise a lot less...

Anyhoo, treated the rig to another case. It's a cheap aliminium box from Maplin but it does the job nicely.
I fitted the varicap diode mod to the VFO hence the case change. This has really made a huge difference given the ten turn pot. Also replaced the display with a blue lit one I had in my junk box.
For tuning up, I put in a switchable oscillator feeding a tone into the mic socket.

Rock solid kit and loads of fun..

Latest pictures in my Photo folder on here (g4jvf)

Can't offer any suggestion other than the broken track didn't perhaps go back right..
One thing I can do is having just changed my display to a back lit one, I have no pressing need for the one I took out.
If you find that your problem is or maybe is a faulty diplay then shout me your address and I'll stick this one in the post for you...

Hi Rob,

I guess the problem is related to the drilling of the vias but like you I have previously repaired these with single strands of wire through the PCB.

It sounds as though you are using a header with ribbon cable? If so make sure its no longer than a few inches at least until you have the display working.

Re measure each pin through from the micro to the display, be carefull with the display pin numbering as its not logical! Here is a data sheet suitable for the diplay you are using, note that many displays have different pin-out:

http://www.rapidonline.com/netalogue/specs/57-0911.pdf

Did you build the MKARS80 as per the instructions before you modded it and did it work OK?

I assumed this was because the enable line was activated, else I thought it defaulted to one line.

> I did have various problems with torn tracks around the pcb display pads due to stupidly drilling the holes out from the 'topside' this unfortunately pushed the pads out of the board in circuit side. However we made small links up and all double check OK for continuity.
>
> I drilled it to fit header pins. Wish I hadn't.

Ok, well I would suggest that you look with your CRO at each pin at the PIC and then immediately look at the corresponding pin on the display itself - if there is a poor quality connection introduced by drilling out the pins/vias this should find it quickly.

From: jackthewhistler
Topic: 2136 Message: 2136

I_m nearly done with the build up and everything seems to be ok -so far.
voltages look ok.
But, the display shows frequency "000,000 12,3V U "
No matter how often i turn the regulators, what could that be ?

2137. Re: Prob: wrong frequency 000,000

Im not sure what you mean by "No matter how often i turn the regulators".

It looks as the micro is not getting the VFO signal, if you can reveive stations check the voltages on Q8 if you cannot receive anything check the voltages on Q11 and Q12 as the VFO may not be running - check also the soldering on L5.

Hi Steve,

Yes, I built the kit as standard and have yet to attach the varactor mod etc.

I finally broke the pads completely off the board removing a header plug just now, so now both the display leads are directly soldered to ic socket pins underneath. The ribbons are about 4 inches long.

I rechecked the data lines just using a logic tester. 3 show pulses, 1 shows pulses @ low. (Pin 10 again)

I scoped the vfo and 10mhz. vfo is approx 4.5v and 10mhz is 2.5v p2p

The most puzzling part is my friend has an earlier and a later pic chip available. We tested both of those and still no output on display. Both show pin 10 as logic pulses low and dc voltage check at .49v.

I'm lost for ideas just now.

Hi Paul,

This is now not necessary, I unfortunately broke the pads removing a plug from the header. So now the leads are directly soldered to the ic socket pins under the board.

Thanks for the offer Philip. I also have a backlit blue display waiting to be used when I finally have things fully working and I'm about to box up.

From: Steve Drury
Topic: 2127 Message: 2141

```
Rob,
If you have a repetitive wave form on the display / micro pins it sounds
as though the micro is waiting for the display to be ready for the next
byte of information, an extract of the code:

busy_check
clrwdt ; Clear watchdog

bcf Rs ; Set lcd for command
mode (PIN 1 of the micro goes low)
bsf R_w ; Setup to read busy flag
(Pin 6 goes high)
bsf Disp_En ; Set En high (Pin 2 goes high)
movfw Lcd_Data ; Read upper nibble busy flag (at
this point data bit 7 - pin 13 - should be set)
movwf Temp
bcf Disp_En ; (Pin 2 goes low)
bsf Disp_En ; Toggle En to get other
nibble (pin 2 goes high)
bcf Disp_En ; and discard (pin 2 goes low)
btfsc Temp,7 ; Check busy flag, high = busy
( checks
goto busy_check ; if busy, check again (if pin 7
wasn't high go round again!)
bsf rp0 ; Select register page 1
movlw Portb_Out
andwf TRISB,f ; Set for disp output
bcf rp0 ; Select register page 0
bsf R_w ;
return

From this you can see that data bit 7 (micro pin 13) should either be
permanently high or toggling low - high.

I hope this helps?

Just one thing, do your friends displays still function in his MKARS80
OK after you tried them in yours?

I agree with Pauls test method - put your finger under the pins of the
LM386, do you get audio? IE hissing, pops or squeals?

If not check the voltages on all pins.

Steve,

Somewhat messed up now!

In an attempt to double check the pic I repaired my programmer and progged a couple of 16f84s. They worked and checked out OK with simple programs. One to the mkars80 display (separated) which worked fine.

So I tried the 16f818 and loaded up the code and altered it to show my callsign. However first programming sequence is erase then program. Guess what, erased but not programmed, it refuses and errors out with 0fff now as a blank chip . Grrrrr.

My friend is away just now till Monday so I don't have access to another chip.

I agree with Pauls test method - put your finger under the pins of the
LM386, do you get audio? IE hissing, pops or squeals?

If not check the voltages on all pins.

OK, from that then we work out the PIC is at fault? Do you want another,
but it won't get to you till Monday / Tuesday?

If so please send me your address by separate email.

Thanks for the tips Gents.
It's late here, I don't have my MKARS schematic in front of me.
But I just briefly went to the PA0RCL site. WOW, lots of spiffy stuff.
In HIS schematics, are the grey shaded areas
of the schematics the NEW added parts, or the exising parts?
And re: the MVAM109 varicap, has anyone tried the NTE618
as a replacement? There's a local house that sells lots of NTE parts.
(An aquiaintance iof mine says "NTE" stands for "NOT The Equivalent",hihi.)
But I have found they are pretty good, The NTE 278 is a very "hot"
(good) 3w driver NPN type RF transistor a la the 2N5109, etc.
tnx es 73, Ken AD6KA

From: tasmod
Topic: 2127 Message: 2149

Hi Steve,
Looking thru the specs for the 818 it appears its my programmer. 818 can do mclr as either adcin or output and mclr needs raising after vpp to set the pin to program. Something my simple serial programmer can't do.

I would appreciate a programmed chip to try. I will mail you separately.

Yes, the NTE618 will work, as that is what I used.

Thanks for the tips Gents.
It's late here, I don't have my MKARS schematic in front of me.
But I just briefly went to the PA0RCL site. WOW, lots of spiffy stuff.
In HIS schematics, are the grey shaded areas
of the schematics the NEW added parts, or the exising parts?
And re: the MVAM109 varicap, has anyone tried the NTE618
as a replacement? There's a local house that sells lots of NTE parts.
(An aquiaintance iof mine says "NTE" stands for "NOT The Equivalent",hihi.)
But I have found they are pretty good, The NTE 278 is a very "hot"
(good) 3w driver NPN type RF transistor a la the 2N5109, etc.
tnx es 73, Ken AD6KA

I used the info on that link to mod mine a couple of days ago
Works very well an makes the tuning a dream...

I used an MVAM109 varicap on my mod...works perfectly...

Hey Steve,

thank you very much for your support.
It was a bad solder point on L5 !
It is ok now and i'll do the final adjustment on the weekend.

2153. Need less bass and more treble

Yahoo group: mkars80
Date: 2011-07-04 14:50:57 UTC
From: Philip
Topic: 2153 Message: 2153

Had a couple of reports that my signal would be more readable
if the mic had less bass and more treble...

It's a cheap electret insert from Maplin..

Any ideas what to tweak in the mic amp to acieve this?

Thought of maybe reducing the value of C10 or maybe increasing
R13 then shunting it with say a 100n or some sutch..

Probably both ideas are silly but what do you think?

Regards

Philip G4JVF

Philip,

Before you look for an audio cure its wise to check your BFO frequency
is 10MHz. How does it sound on receive? When the BFO is adjusted
correctly the received sound has quite a bit of treble (not much bass),
if the BFO is simply adjusted for armchair copy it will often be set wrong.

From: Philip
Topic: 2153 Message: 2155

Hi Steve....

Hadn't thought about that.
Received signals sound OK but I will be sure to double check that.

To be honest, out of the few QSO's I've had so far, more people said the audio was OK than those who mentioned the bass.
A guy who was giving me the most feedback said it was fine but being a small signal under noisy conditions, he thought a more treble audio would make copy easier under the conditions...

I reckon it's probably fine anyway but I see his point.

Thanks for the suggestion, as I say, that will be my next thing to check the BFO is set OK..

Might try a standard mic as well for comparison.
I presume for a non electret mike I just lift the resistor feeding voltage to the mic?

Steve

I've tweaked the BFO to exactly 10Mhz by loose coupling it
to my SDR receiver which has been calibrated zero beat to a time signal.

It was out by a couple of Khz so at least now it's spot on.
Will try again then maybe try different mics...

Thanks again for your help

2157. Need help adjusting PA Bias.

Yahoo group: mkars80
Date: 2011-07-05 15:04:04 UTC
From: Rick
Topic: 2157 Message: 2157

Hello,

Just finished my MKARS80 and now busy with tuning the rig.

Everything goes fine until now. I need to adjust the current of the rig in TX mode with R2. Measure the value in TX mode and increase it with 50 mA.

The problem is that when i push the PTT switch, the meter reads 246 mA but tuning R2 doesn't make any diffence. I can turn it from counter-clockwise until clockwise but the meter stands still on 246 mA.

When i whistle in the mike the current increases untill .9 A (Almost 1A)

What could be wrong? Where do I have to look?

With kind regards,
Rick, PE2AAB

2158. Display working at last :-)

Yahoo group: mkars80
Date: 2011-07-05 20:38:28 UTC
From: Rob Lane
Topic: 2158 Message: 2158

Well what a trial that was.

Combination of things:-

The pic chip was duff.
The pic chip socket was duff.(Yes the socket)

I tried my pic chip in my friends working kit and the display was blank.

So that showed that to be duff.

Steves kindly supplied replacement worked nicely in my friends kit, so now I had a working chip.

Tried the working chip in mine and again two lines of dim blocks showing.

Cue much head scratching. Removing the chip and testing all lines again for the umpteenth time showed no shorts in any direction. Either pin to pin or to ground.

By now all that was left was the socket. Can't be can it? We tested every line and connection as clear!

OK bite bullet. Cutters out and carefully cut apart the socket and leave pins to see if anything's there.

No, nothing to be seen.

Desoldered all the pin pieces. Fitted a turned socket pin row instead of a socket. Fit working chip.

Switch on with baited breath.....

Success !!! A fully working display, one happy man.

I and friend still cannot work out what it was in the socket but it appeared to have loaded the data lines but defied continuity tests ?

Finally I changed the kit display to a newly arrived blue backlit version. Tested again and still working.

A big thanks to Steve for his generosity and others for their suggestions.

Now it's on to boxing up and transmitter tests.

Rob G4NQX

2159. Re: [mkars80] Need help adjusting PA Bias.

Topic: 2157 Message: 2159

Rick,
It sound as though the PA is working so you must have a fault in the
bias circuit, return the control anti-clockwise until you find the fault.

Whilst holding the PTT down check for volts on D1 - it should be about
5.6V, if OK check R2 with a meter to make sure it isn't damaged. Check
he area for short circuits on top and below the PCB.

Regards,
Steve G6ALU

I'm glad its working Rob; I've not had a faulty socket either - by their design not much can go wrong. I actually prefer the side contact type to the turned pin type.

All the best,
Steve G6ALU

Topic: 2161 Message: 2162

Did you download the template, open it in Adobe Acrobat and then print it with the paper size set to A4 and the page scaling set to 'none'?

If you don't have the page scaling set to 'none' the print may be the wrong size.

73
Peter VK3ZPF
http://vk3zpf.blogspot.com/

Printout with Adobe Acrobat reader, set paper size set to A4 and page scaling set to "none". Stick onto case as described in construction manual and use as a drilling template for the holes and cutout.

Hi.

If you are a member of the GQRP club (& if not why not [;)]) then
Graham has them at 50p plus postage max 2 per order.

I bought 4 from a UK Ebay seller some time back but I can't remember the
price.

Thanks for that, I've sent him a message to see if he has any left.

Hmm. Bit cheeky to join QRP Club just to get diodes. however may do so as I've always liked the odd article I've read from the Club.
A link from their site took me to G4FON site and he has an interesting loop design for qrp on 20m. This would suit my BitX20 rig.

Subject: [mkars80] Varactor diodes

Where's a good source for the MVAM109 diodes ?

I've tried Birketts, Bardwells etc.

Only one ebay seller in the US and he won't sell international. Can't blame
him after my ebay experiences with international selling.

From: vk4apn
Topic: 2172 Message: 2172

I feel compelled to write and express sincere admiration for the team that put together the MKARS80 project.

I am an experienced constructor and builder and would rate this kit as a real winner. Everything about it is well done....superb PCB, top rate manual, all parts fitted the PCB footprints, a STABLE vfo arrangement. It also works very well.

I would not normally build such a high component count kit in the order the manual sets out, but I bit the bullet and followed the order as written - except, I tested all active devices and measured all coils, etc before installing on the board.

The only Brickbat - would be to change the tuning capacitor (to multiturn varicap and possibly add in some crude AGC arrangement per some of the examples in the files section.

An absolute delight to build and use - I will be spreading the news.

I would second everything you say Paul..
Recently built mine and modded it to varicap tuning.

Got my kit yesterday for building the CW adapter and I'm amazed at
the quality of both these kits.
The PCBs in particular are superb...don't know how they put all this
stuff in bags for the low price the kits come in at.

Best value kit on the market I reckon and it all works nicely to boot..

2174. CW adapter

Yahoo group: mkars80
Date: 2011-07-10 21:04:38 UTC
From: Philip
Topic: 429 Message: 2174

Had fun today putting together my CW adapter kit..
Great value for money it has to be said.

Put it in a cheap alulinium box from Maplin, a bit smaller
than a similar box I put the MKARS 80 in.

All went OK and worked first time.
Plenty of space to add a resistive SWR bridge and maybe a QRP
ATU using toroids.

Just got to brush up on my CW but now I have a reason to get stuck in.

Nobody laugh at my bodged sideswipe key :)
It works better than it looks..

As usual some more pictures in my photo album on here (G4JVF)

Regards
Philip G4JVF

Nice work - I wonder what is the basis of the added fan? Did you find it was needed?

The reason I ask is that I note on my unit (MKARS80 only)that it will sit all day with the + sign only and does not budge on freq at all. During transmit, however, I notice after a very short period the bars start to appear and eventually the lock is lost - so I am assuming that there is a heat effect going on - but nothing obvious to me so far. The heat generating components are physically well removed from the VFO circuitry. Unit is boxed up and not open the the atmosphere. So I keep overs very short until I get on top of it!!

The ambient temperature in the tropics is usually 25 C at this time of year (dry season) and will be 30 C during the wet.

All part of the fun

Hi Paul

No, not had any stability problems but preempted that the PA
would get warmer when I got round to using it on CW.
So, whilst I was drilling the case for the receiver, I put in a fan (switched) just in case....
It's a 12 volt fan but fed via 200 ohm resitor so it spins but doesn't
run fast enough to whine...
The fan is directly over the PA....

Great fun this range of kits...

All tidied up and tested today...
Only mod I've done to the CW adapter is to increase the value
of C22 from 10uF to 47uF to get a longer hang time.
Only did this because my CW is painfully slow at the moment and
this stops lots of relay clattering :)

2178. RE: [mkars80] Re: Help with winding torroids

Yahoo group: mkars80
Date: 2011-07-13 09:31:28 UTC
From: John Martin
Topic: 2111 Message: 2178

Hi Paul,

Only just found time to look at the project again.

What I meant was that after following the initial testing as detailed on page 11 all voltages were as per spec however the para that starts "connect Antenna" advised that some noise should be heard only I got nothing indicating incoming signals. I have tested the input to the audio amp and there is a change (mains hum) so that seems ok.

Obviously something is not right but as yet I have not found out what. Something I saw in the forum was that a faulty torroid could be the problem although I may have taken this out of context but I wanted to know which one was most likely to save wasting time and effort in the wrong place. I doubt it's a faulty component and I have taken great care with the soldering but the torroids were another matter.

However my next job is to go round and do the voltage checks to see if anything comes to light.

Regards,

John

When you say no audio - do you mean:

You cannot hear any signals with an antenna connected (or sig gen etc)

or

The audio stage itself has no output? i.e. with your ear to the speaker do you hear a faint hissing? If you touch your finger to the lm386 input can you hear a change?

Really need more concise description to help further.

Hello John,

The most common problem is soldering on the mixer transformers - 2
transformers on the first mixer and one in the BFO.

Make sure they are soldered with a very hot iron to break down the
enamel insulation.

Got 22 QSOs under the belt of my MKARS80 so far...
Great fun :)

2181. Can someone help with whereabouts for a soldering iron element.

Yahoo group: mkars80
Date: 2011-07-13 21:39:47 UTC
From: lc0tc
Topic: 2181 Message: 2181

I was about to start winding the toroids, coils and transformers, of my MKARS80 kit when my old and trusted Litesold 15W iron expired. The element had burnt out after only 25 years or so.
This was the sort with a red plastic handle and REAL unplated bits, and the elelment was/is covered with a layer of steel wire wound on. I had fitted a 220v element to suit the mains voltage where I live and was very comfortable with this tool.

I use Weller LR21s at work and so am used to ironplated bits and temp regulated irons but I'm having difficulty in getting used to such an iron in my own shack, I miss the speed with which the solder melted once applied to a plain copper bit.
Does anybody have knowledge of a source for elements for these irons? I have a 240V one but this is equivalent to maybe 12 or 10W when supplied from 225V, and just isn't hot enough.
As far as I can find out from the all pervading internet, Litesold do not sell anymore or even produce.

Peter

I would recommend at least a 30 Watt iron when dealing with the MKARS80 toroids in order to melt the enamel on the wires.
Best to "tin" the ends of the toroid wires before soldering them into the PCB.

Best 73

I would say it is essential to tin all the enamel clad wires before you solder them to the PCB..... a syringe of SMD flux paste (a must have for your soldering kit) allows you to easily place a very small amount of flux directly and ensure a 100% confident joint.

2184. Pre - tinning enamel clad copper wires

Yahoo group: mkars80
Date: 2011-07-14 08:07:08 UTC
From: vk4apn
Topic: 2184 Message: 2184

After I posted my comments re tinning enamel wires prior to soldering into the PCB, I thought I should explain my thoughts a little more clearly......

Over the years I have used a multitude of these wires - some retain their enamel even after a nuclear blast, others lose their enamel just by looking at them, some you have to scrape off with a Stanley knife and everything in between those scenarios.

Mostly these days, the majority of enamel coated wires are designed to melt the enamel away at a certain temperature and leave you with a nice shiny easy to solder wire. Now, if you trust that soldering the coated wire directly into the PCB will burn away the enamel coating and give you a 100% perfect joint - it may well do that - or NOT. But it is not easy to tell visually 100% of the time. Also I measure the inductance of newly wound L's before fitting so I need a nice shiny wire to connect my LC meter.

So I would suggest that once you have wound the toroid / transformer, trim the leads, using your soldering iron loaded with some solder burn off the enamel until you have a nice shiny bright wire. Then mount onto the PCB so that the nice shiny bright wire is thru the PCB, then solder - ensure that there is still enamel insulation left to prevent component side shorts.

It is also possible that you can scrape off the insulation when winding the inductor - so some care is needed, if you think that might have happened I would start again - to avoid latter painful fault finding.

My .02c worth....Paul vk4apn

Sound advice Paul...

Must admit I always scrape my coil ends no matter what
type of coating just to be sure.
Never had a failure yet but it adds a bit of time to the build...

I usually just use a fine coated sandpaper. I tear off a small piece (1" square or so) and just fold it around the wire end and pull off. Several times and the wire is shinny without the danger of cutting it with the knife blade. Works every time. 73 Mike KF6KXG

2187. Messing with the mic amp

Yahoo group: mkars80
Date: 2011-07-18 10:50:33 UTC
From: Philip
Topic: 2187 Message: 2187

Early days yet but decided to experiment with boosting the mic signal into my MKARS80.
I was getting out OK but some reports said a more treble level to my mike audio would help make the QRP signal easier to copy in noisy conditions.
Also, I was having to "talk up" the mic with a raised voice which wasn't comfortable. Mic is a standard electret computer mic.

Anyhoo, came across this little circuit and built one into a seperate small aluminium box with a PP3 for it's power supply.
Picture in my photo album (G4JVF) of it sat on top of the MKARS80 pyramid :)

Link to the circuit in question....
http://www.rason.org/Projects/speech/speech.htm

Plugs directly into the MKARS mic socket at the moment but at some point I will isolate the MKARS mic amp and try this in it's place as an experiment.
Trialed it last night and a patient ham listened and reported as I set it to various gain settings.
Not switched in the processer part yet, this was just using the circuit as a standard mic pre amp.
About half way up on the gain setting got me a report of punchy good listening quality audio, speaking at normal levels about 2 feet from the mic.

A few QSOs later in the evening all gave me a good signal and redability report without me mentioning the audio mods so I'm very pleased with the results so far.
Every station I called came back to me that night.
Even got a PA2, my first MKARS80 QSO out of the country on my low 80 meter dipole....

I also have my mic modded as per the file on here with a 22K/0.1uF, in series with the mic to lower the bass.

More later as I dabble some more

My MKARS is working so far :)

I can hear many stations but when i transmit i hardly get heared.
Current draw while talking is only 0.5A (at 12.6V) which is a bit suspicious to me, as the manual says 1.2A. ? I adjusted bias form 0.25 to 0.29A .
Any idea what that could be ?
Thank you in advance.

Hi, Jack I guess?

First do a voltage check which should show up any wrong components, if
all OK then check to make sure all the solder joints on the transformers
are good - there has been much discussion on the group about the best
way to "tin" the wires - poor solder joints to the enamelled copper wire
is by far the most common problem.

> Also, I was having to "talk up" the mic with a raised voice which wasn't comfortable. Mic is a standard electret computer mic.

Wow my el-cheapo electret insert has bags of audio, so much so I added a heavy duty mic sock / wind sock to help reduce the level. it might be worth trying a few different inserts. Having said that I like to play with audio bandwidth, peaking (Heil inserts) and my old faithful 1980 Practical Wireless processor (its still my favourite).

> About half way up on the gain setting got me a report of punchy good listening quality audio, speaking at normal levels about 2 feet from the mic.

I like to speak no more than a 50mm distance from the microphone so may that is the difference? My radio area is too "bright & echoes a bit" for a high gain mic.

I have uploaded a couple of pics under vk4apn a simple amp design by PA0RCL to help even up the RX/TX levels. As it is the basic radio is really very good.

Hi all...

I was going to say there is something wrong with the radio until I realised you were speaking so far from the microphone - I speak in a normal voice about 6 inches from the mike and find thats about right.

Remember the red modulation LED should just flicker off whilst speaking, if it is off most of the time the PA is doing the compression for you!

From: Philip
Topic: 2187 Message: 2192

Don't get me wrong, the radio as is, works very well (led dims as expected) but I wanted to be able to move away from the mic a bit and also wanted a bit more audio punch when needed under noisy band conditions.

Not tried another electret insert yet, a couple of different types on order..
Another session last night and all stations called, heard me even though band conditions were only just fair...

Decided to leave this addon as a seperate unit from the rig as it gives me more options to experiment with different mics eg dynamic fist mics...

Amazing litte rig and oodles of fun :)

Ok, I have now been using the radio for enough time to add to my initial comments from some time ago.
This may or not be relevant.....
Firstly the ambient temp here is always between 25 - 30 degrees C. I live in the tropics.

There is drift occurring even after radio has been on for hours, it will lose lock and jump several khz low - this is while listening only, although, at times it will sit for hours and not budge?. When transmitting the + sign starts to move to the right after say 30 secs and continues to do until lock is lost - so I keep overs very short! After releasing the PTT the bars continue to creep right, sometimes reverting other times losing lock.

The radio is boxed up and the PA device is well heat sunk and really does not get that hot. The correct 1n caps are in c59/60 positions.

I remember going nuts in the past trying to tame conventional VFOs so I thought I would ask the group before I start going around in circles!

If I cant stabilise to a reasonable extent I will revert to using a DDS circuit, so I am certainly not going to lose sleep over it, but would like to improve if possible.

Paul vk4apn

From 11/07/2011
The reason I ask is that I note on my unit (MKARS80 only)that it will sit all day with the + sign only and does not budge on freq at all. During transmit, however, I notice after a very short period the bars start to appear and eventually the lock is lost - so I am assuming that there is a heat effect going on - but nothing obvious to me so far. The heat generating components are physically well removed from the VFO circuitry. Unit is boxed up and not open the the atmosphere. So I keep overs very short until I get on top of it!!

My MKARS is rock steady. I switch it on in the morning, and it will fire up at a particular frequency and lock. 5 hours later if I leave it alone it is still on exactly the same frequency (I have to say that I find this quite disturbing!).

If I use it to transmit, it still doesn't shift. The only times I had frequency shift when transmitting was when the power supply did not have enough capacity.

The rig never made its way to a box, and I have an aluminium heat sink on the IRF510 which gets very hot. The shack temperature is usually a pretty steady 22-23C.

Yes, mine behaves the same way at times and remains rock steady. The freq jump on Rx is random. On tx it is certain.

First thing I checked was to see if there was a voltage drop - negative. I have run it on 2 different 20amp supplies and SLA battery, so can count that out.

Yes, my projects usually stall when it comes to any sort of metal bashing...
thanks

Paul

My MKARS80 is very stable after an initial 5 minutes or so warm up.
I found a dramatic improvement in stability after I did the varicap/10 turn tuning pot mod...is yours using the original tuning capacitor?

I am using the original polycon, but with a reduction drive as per another recent post. I took great care to ensure there was no mechanical stress on the polycon. i.e. I secured the pcb to the case first, then fastened the reduction drive to the polycon, finally fastened the 2 M2 bolts holding the drive to the front panel. I am pretty sure it is not mechanical?

Anyway, which version of the varicap mod did you do?

Thanks for responding.

This one Paul

http://pa0rcl.com/PA0RCL/MKARS80_files/Tuning_MKARS80_1.1.GIF

I used an MVAM109 varicap diode.
This mod really turns a great little rig into an even greater one ..
Very stable tuning with virtualy no need for touching the fine tune knob.
Frequency change goes the right way and it's easy using the pre set multi turn to set your desired bandwidth exactley how you want it.

Well worth doing...

Regards

I had frequency drift issues when I put a small amplifier in mine. After a few short overs, it was impossible to control!!??!. It would drift in one direction whilst transmitting, then just as you retuned for lock, it would swing the other way.

After removing the amp (it flattened the battery anyway...), I noticed that the drift was still there, but not bad enough to lose lock. In summer down here (Sydney), if I pull the rig of the cool house and take it outside I have to leave it for a few minutes to stabilise, or it continually unlocks. Once 'soaked' though, it's pretty good.

Personally, I don't think that the standard case is good enough as a heatsink in 30+ temps. It just gets too hot - part of my reason for choosing a larger case and a nice slab of 3mm AL for the heatsink. You could try putting a slab on the outside of the case to slow the rate of temp rise - this might slow the drift down enough to remain in lock.

In all honesty, having played with VFOs and stabilisers a lot, I am intrigued by how well the MK' works in this regard. I never had as much luck with my own endeavours!

I made my own case that just fits - all a bit tight anyway, so will relocate to a larger enclosure with more substantial heat-sinking - although my unit doesn't get all that hot on TX. Metal work and I just do not get on - my enclosure looks like my dog made it.

I just built a version of the 40w PA0RCL amp in its own solid diecast enclosure.

I agree re the huff and puff - its pretty smart.

Hello Folks,

Aldi stores are selling fishing bags at £9.99 that are perfect for the MKARS80 and indeed most /p operation. I have easily fitted the MKARS80, CW adaptor, HB ATU, 17Ah battery, W3EDP wire antenna, all leads and more.

The bag is very strong (no problem for the 17Ah battery) made from nylon canvas effect material with carry handles and shoulder strap see http://www.aldi.co.uk/uk/html/offers/offers_week32Sunday11.htm I will also post a picture in the photo section with all the MKARS80 bits in it. My local store (Aylesbury) had quite a few of them as of today (11 Aug 11).

I got this kit about 3 or so years ago, and with work, retirement, illness, etc., I am finally getting a start on this. One question. I have been looking through the messages for something on cutting the rectangular hole for the freq meter. Anybody got a easy way to do this when you don't have a shop or many tools around? I do have a dremel tool, but don't think I have the right bit to do any cutting. I have seen some pretty good looking cases and wondering how they came up with them. I have seen the messages about the template sizing. Thanks in advance.

73, Kent KC9LIF
